What's new in Clarion 9

Over the summer a number of new blog posts appeared at <http://clarionsharp.com> pointing out new features in Clarion 9. These include:

- A new locator on the Applications Pad, useful when working with multi-app solutions.
- A new menu shortcut editor to let you redefine IDE main menu hotkeys.
- Dictionary editor search functionality (search through tables, columns, keys, relations, pool and global data). Complex searches are possible.
- One-prompt app file upgrading for multi-app solutions (so you don't have to answer the question for each app)
- Coloring support for list control headers and data.
- Search/replace in editor has a new option to limit the search to the current folder, which is the folder containing the currently active file. This may or may not be the same as the project folder.
- Customizable fonts for the AppGen and various IDE components such as dialogs, list controls, start page, and the text editor/output window.
- A filtered locator on the property grid, to make it easy to find any property.

- Report upgrades, including:
 - single file support for HTML reports
 - setting the first page number (ABC)
 - print current page menu item in previewer (ABC)
 - scan copy output mode for the PDF generator (creates PDF as an image rather than as text)
- New %libpath% macro in the Copy section of redirection files. This makes it easier to add .NET assembly projects to your Win32 solution.
- PROP:LowResourcesHook lets you add code to handle low system resource conditions.
- PROP:SQLRowSet allows calls that are not CALL or SELECT to return a result set.
- New Create and Fetch dictionary triggers
- New buttons to change the AppGen sort order, as well as Cancel Generation and Cancel Builds on the main IDE and Applications Pad toolbars.
- Template option to limit procedure to one instance (ABC)
- Template option to limit application to one instance (ABC and Clarion)
- FileCallBackInterface extended to allow an operation to be stopped without returning an error.
- Dictionary editor validation option to find errors in window and report control strings in dictionaries imported from earlier versions of Clarion.
- Option to force DLLs to be copied to the destination dictionary of the EXE using the LibAlwaysCopyList.xml configuration file. This is useful for LIBs created against non-Clarion DLLs as the DLL would otherwise not be copied.
- A new advanced view/layout in the Dictionary editor lets you see all file details in one combined view.
- SqlScripator\SqlScripator.app shows how to use the new SQL scripting class
- SQLite\School.app is the school.app modified for SQLite. It also imports the TPS data.
- There are a couple of hand coded projects to demonstrate creating and reading XML files. Here's the XMLParser example in action, reading a file created with the XMLGenerator example:

Third party products available for Clarion 9

Clarion 9 versions are available for the following products:

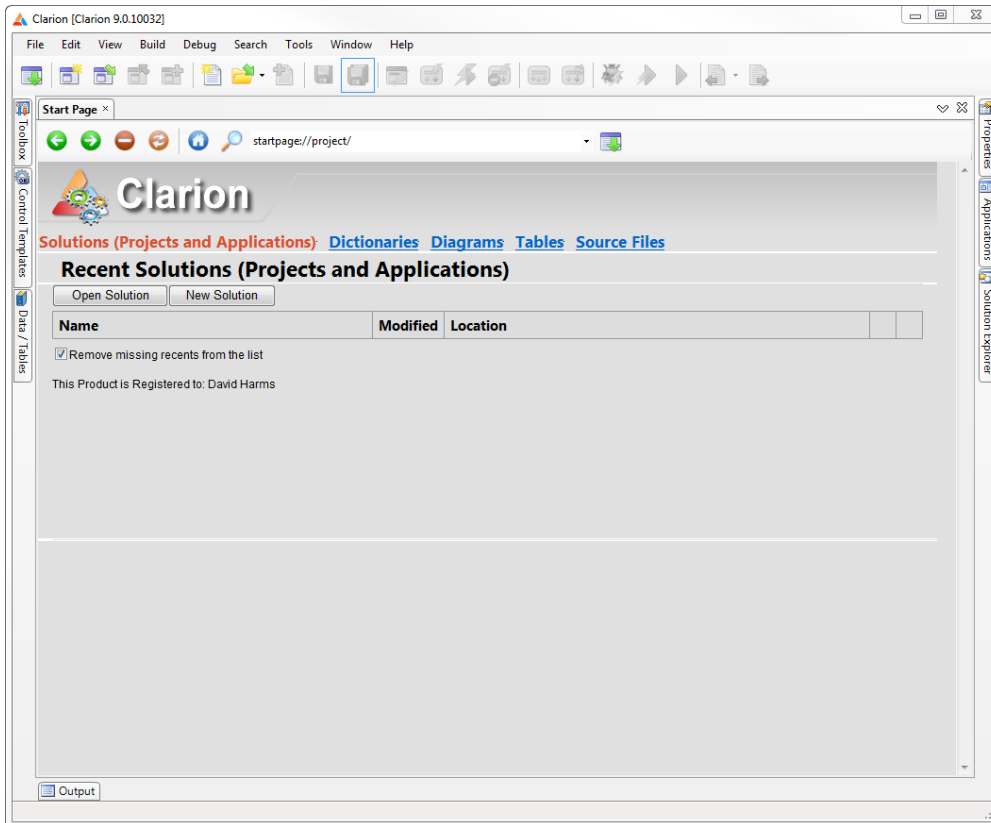

- AuraTek - Query Wizard - http://clariontools.com/index.php?option=com_staticxt&staticfile=qw6overview.htm (beta)
- BoxSoft - Super Templates - <https://boxsoft.net/supertemplates.htm>

- Brahn Partridge - Clarion IDE Addins - <http://clarionaddins.com/>
- Capesoft - <http://www.capesoft.com/clarion>
- Clarion FreeImage - <http://clarionfreeimage.com>
- Clarion Handy Tools - <http://cwandy.com/>
- CPCS, RPM, AFE, PNET - <http://www.cwaddons.com/>
- Creative Reporting (formerly known as CPCS) - <http://www.creativereporting.com/>
- DMC - <http://www.dmc-fr.com/>
- Fomin Report Builder - <http://www.fomintools.com/update.htm>
- IceTips Utilities - <http://www.icetips.com>
- ImageEx - <http://www.solidsoftware.de/imageex.htm> (now with full source)
- IngaSoftPlus Data Conversion Template - <http://www.ingasoftplus.com/ProductDetail.php?ProductID=259>
- Keystone - <http://www.keystonecr.com/ToolsForClarion/ToolsForClarionUpdates.aspx>
- Klarisoft wPdfControlWrapper - http://www.klarisoft.com/KSNews_127.htm
- LANSRAD - <http://www.lansrad.com/>
- Lindersoft LsZip - http://www.lindersoft.com/products_lszip.htm
- Lindersoft SetupBuilder - <http://lindersoft.com/>
- Noyantis - <http://noyantis.com>
- ProDomus - <http://prodomus.com/>
- Robert Paresi - iQ-XML - <http://paresi.net/clarion>
- Valutilities - vuMail, vuFileTools and vuSendKeys - <http://www.valutilities.com/vufiletools.htm>

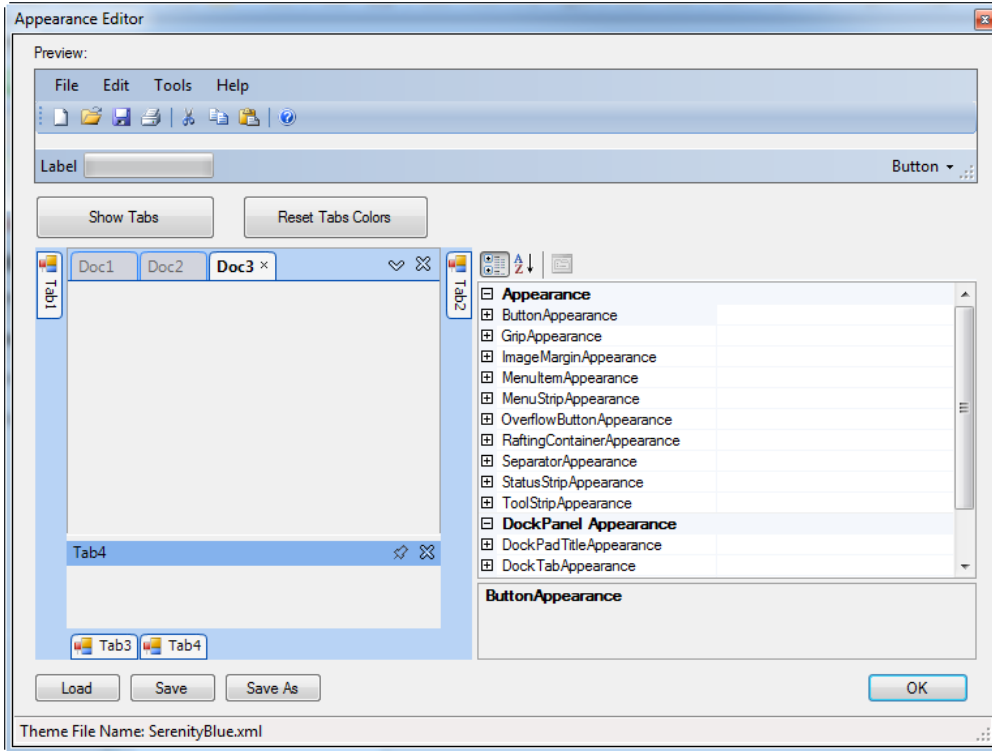

Clarion 9 Beta First Look

The first Clarion 9 beta has gone out to third party folks, at least in part to allow those vendors who ship binary code to get current releases out the door. The Clarion 9 RTL has changed enough that recompiles are required.

As with previous releases, the Clarion 9 IDE has undergone some UI changes. There's a new logo and the default blue backgrounds have been replaced with gray.

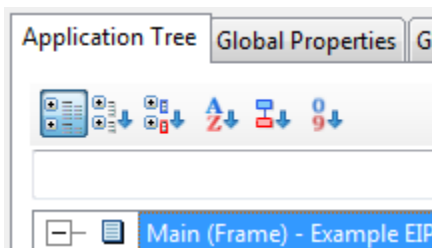

There are some new appearance options, which let you select one of several default color schemes for the IDE. You can also create custom schemes.

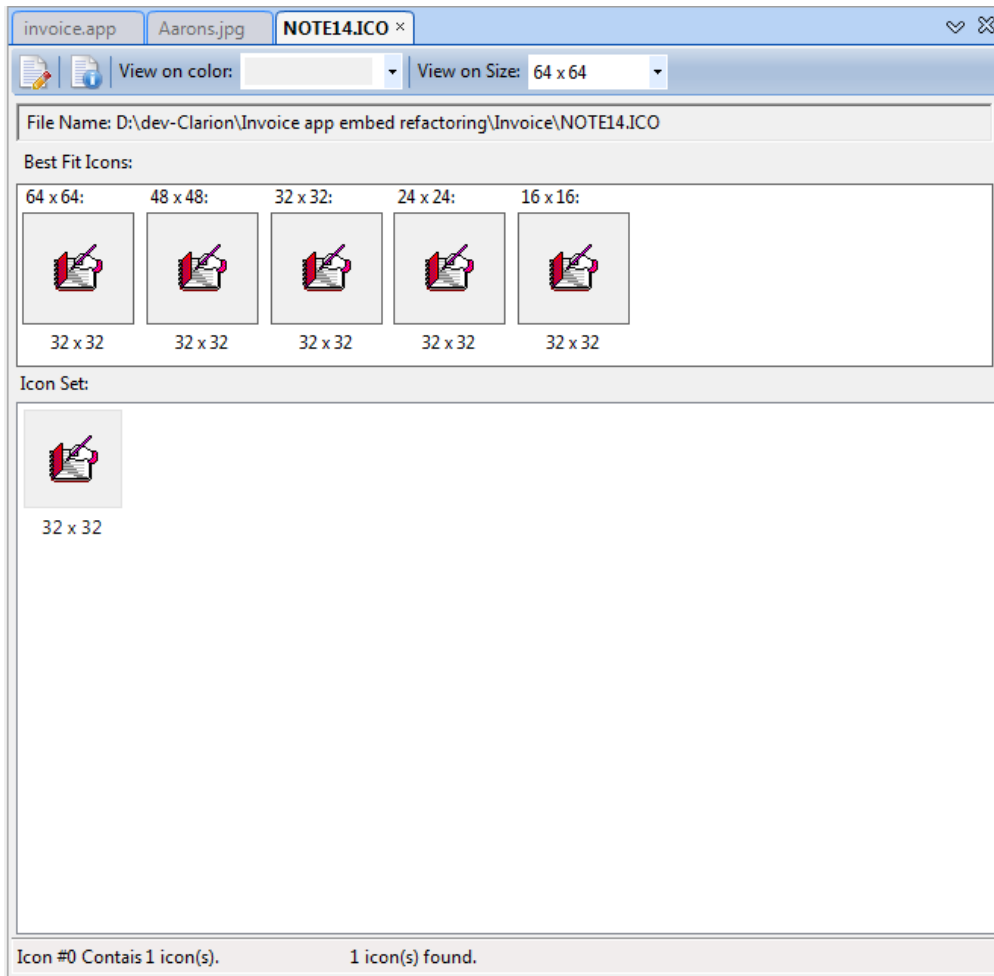

There are also options for using small icons on toolbars, specifying font sizes for four main areas of the IDE, and an easy way to customize shortcut keys.

The `/ConfigDir` command line parameter, which lets you specify a different configuration directory, is now documented. If you use `/ConfigDir` without specifying a folder name then the IDE settings are kept under the Clarion bin folder. You can use `/ConfigDir` with `ClarionCL` and `ResetIDE`.

There are five slightly ambiguous buttons above the AppGen tree, which you can use to change display mode. Although this is more efficient than using the drop list, one could argue that they should be on the right, in place of the drop list. It would also be helpful if they had hot keys for keyboard aficionados:

There's an image viewer in the IDE which works with various image types including icons and PNG files.

There are some enhancements to file dialogs which now remember the last place they were opened or use the redirection file to find possible matching files on first use. In the editor you can search the current document directory, and you can exclude generated source from searching while in the embeditor.

In general the IDE has a bunch of little improvements, including manually clearing ABC cache files, copy and select buttons on errors, output and search pads, GUID generation, filtered properties locator, dictionary search improvements, and many more.

There is a new SQLite driver (with example app). SQLite is a highly popular database primarily intended for single use situations such as personal application data. There is also a new SQLExecutorClass that makes it easier to create and execute SQL scripts made up of multiple statements.

For all SQL drivers there is a new PROP:SQLRowSet "that can be used to execute SQL statements that return result sets, but are not SELECT or CALL statements."

There is a JSONDataClass to convert Clarion variables and structures (including queues) into JSON objects.

There is ABC support for enforcing single instances of applications and single instances of threaded procedures.

A new SystemString class provides extensive string manipulation functionality including compression, blob conversion and much more. There are over 80 methods in the class.

There are also a couple of new classes in support of reusable user-defined controls; it will be interesting to see how this pans out as control reuse (think browses, for instance) has been something of a holy grail for Clarion devs.

I've really just skimmed over the new features - there are rather a lot of these, and I want to get on to a few more specifics.

Comparing releases

Any time I get a new release of Clarion I like to compare the install directories to look for things that are new and which may not yet be noted in the docs.

Things that went away in Clarion 9 include the blue gradient image file (presumably used in the IDE), CommonUtils.tpw which contained

procedure parameter list code (presumably this has been replaced by the previously announced improvements in how the AppGen displays prototypes and parameter lists), and clazlib.lib (I'm guessing compression/decompression is now baked into the RTL). Various files under the bin directory also seem to have been moved or replaced.

There is a new ABUserControl.tpw which is clearly in support of the new user controls functionality. It includes some procedure templates, which perhaps are where the controls are declared, as well as an extension template to attach user controls to a window.

New source files include the aforementioned user control, string, JSON, SQLite and SQL script classes. There are also a couple of new INC files. ClaTALK.inc has prototypes for SendMail and SendSMS library procedures (the matching lib appears to be missing, however), and ClalMG.inc has prototypes for image file to PNG conversions.

H5 Builder

The help doesn't contain any mention of [H5 Builder](#), SoftVelocity's announced multi-platform web development tool. But there are number of web-related files in this install that weren't in the last Clarion 8 version. Some of these are old Internet Connect-era files, and H5 builds on Internet Connect and Web Builder, SoftVelocity's previous web development products. I'll touch on these a bit more below.

Template changes

Template changes include the removal of a separate Parameters prompt, most welcome since it's been years now that prototypes and parameter lists can (and should be) the same, with the exception of the return type (if any).

There are a few new embed points here and there. File lists now typically include a %TableSchematicsDescription variable. Triggers have grown a bunch of new embed points. There are a number of changes to support single instances of applications and procedures, also previously mentioned.

Source changes

WindowExtenderClass has some new methods. I'm a little embarrassed to say that I don't think I even knew this class existed, but it's in Clarion 8. New methods include GetEXEFileName, IsInstanceRunning and RestoreInstanceRunning. Many of the other class methods deal with system tray icon handling.

There are a number of IC* files that have been updated, and I think it's safe to assume that IC stands for Internet Connect. So again that argues for progress being made on the H5 front.

Touch friendly?

While looking through the changed files I came across a couple of new calendar windows that were labelled with this comment:

```
!! Window structure for the Small popup Calendar Touch Friendly
```

There are also some matching classes.

If you feel like speculating, there's a [SoftVelocity post from January](#) that mentions touch-enabled software.

Reports

There are substantial changes to the source that supports report generation targets. It looks like a new IOutputGeneratorTarget interface has been abstracted out of the IReportGenerator interface.

Summary

There are a number of intriguing new and changed bits in this first Clarion 9 beta. Tops on my list are the SQLite driver, the SystemString class, the SendMail and SendSMS functions, the removal of the separate parameters prompt from the AppGen, JSON support, SQL improvements, and support for user-defined controls. As I said earlier there are other little nuggets awaiting discovery; if there's something in Clarion 9 that you're particularly happy to see (or something you were expecting that isn't there), please post a comment below.

Clarion 9 apps using Report to PDF to require C++ redistributable?

There's a thread in the Clarion 9 newsgroup that seems to confirm that if you're using the ReportToPDF functionality in Clarion 9, any such apps will need to also have the Microsoft Visual C++ 2005 Redistributable installed on that machine.

The tricky thing is that your apps may run fine on your test machines because you have the 2005 Redistributable, but then things blow up when you ship product to your customers.

Here's a post by L Jack Wilson on the subject:

Geert,

I imagine the PNG support requires ClaRunExt.dll, since libmaker reports it contains:

?ImageToPNG1@@YAJPBD@Z

?ImageToPNG2@@YAJPBD@Z

?RotateFlip@@YAJPBD@Z

?SaveThumbnail@@YAJPBD@Z

Have you tested your app on a machine that doesn't have Clarion 9 IDE installed? I too use the ReportToPDF and noticed I need to have the ClaRunExt.dll in my program directory or my main exe will not load.

I also found with a fresh install of my program on a Windows 7 32-bit box I could not launch an app that requires ClaRunExt.dll to be present without also installing Microsoft Visual C++ 2005 Redistributable - KB2467175 8.0.51011. This same redistributable is installed by the Clarion 9.0.10294 installer. Without that installed any programs that required ClaRunExt.dll would fail to run with a 0xc0150002 error.

Using dependency walker on ClaRunExt.dll tells me it requires the side-by-side "stuff" that the redistributable installs (along with the other ms dlls).

In reply, Diego said:

Hi,

All that Jack is saying is correct.

Regards,

Diego Borojovich

www.Softvelocity.com

If it's the PNG support that triggers this, then perhaps any use of PNG files will require the C++ redistributable.

Graham Dawson wondered how to check for an existing installation of the redistributable. Richard Rose pointed out a couple of registry keys (the 2005 package is the one Clarion apps need):

- VC++2005 (SP1):
HKLM\Software\Microsoft\Windows\CurrentVersion\Installer\UserData\S-1-5-18\Products\B25099274A207264182F8181ADD555D0
- VC++2008 (sp1): HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\Uninstall\{3C3D696B-0DB7-3C6D-A356-3DB8CE541918}
- VC++2008 (original): HKLM\SOFTWARE\Microsoft\Windows\CurrentVersion\Uninstall\{FF66E9F6-83E7-3A3E-AF14-8DE9A809A6A4}

The easiest way to deal with this seems to be to build your installs with [LinderSoft's SetupBuilder](#), which can install the 2005 redistributable if it isn't already present. Yes, SetupBuilder is an additional cost but if you ship product it's almost certainly a wise investment even without this feature.

Update: Confirmation by Bob Z

Bob Zaunere has confirmed the above requirements:

In the current C9 release you do need 2 things when distributing your program;

1. installation of the the 2005 VC++ runtime (x86), *note: in the next release (today or tomorrow), you will not need it _unless you are using the PDF Report Generator, and then _only _if you are using the new "Use Scan Copy Mode" option, which by default is OFF.

2. ClaRunExt.dll (located in the Clarion BIN folder)

If you use SetupBuilder the install of the VC++ runtime (x86) is all handled by a checkbox located under: Setup Requirements->Core PreRequisites.

We'll also be shipping a redistributable .exe that will handle the install of the VC++ runtime (x86) for those who may deploy via .zip or .rar

Note the phrase "current c9 release" - in future releases the runtime will only need to be installed if you are using the PDF Report Generator *and* specifically using the new "Use Scan Copy Mode".

Update: More details on the "scan copy" innards, from Diego:

 Deeply inside is converting the report to a png of some resolution and color deep to be able to keep the information of the report (font, images, resolution, content ,etc) exactly the same. With out hte need of embebing the Fonts or to support any other images formats and adding security to the content (a PDF is just text when not compressed and encrypted) Eastern char sets now can be used in the PDF with out having to store the fonts or have the Font in the user. With out that option the PDF engine process the report and re-create the report in PDF format, but not always the result is 100% exactly but using this option the print out of one and the other are 99.98% a match.

Graham Dawson has confirmed that when you use Scan Copy you do in fact get a PDF that is composed of images only and contains no searchable text.

Update: ClaRunExt.dll now dynamically loaded

As of build 10309 ClaRunExt.dll is no longer statically linked. From a post by Bob Z:

 That .lib file is not needed because there is no static linking to Clarunext.dll - its been changed to a runtime dynamic load that only happens _if you are using the new 'Scan copy mode', so if your .app/project is looking for it then either;

- its a leftover project reference from when it was a static link, and you can just delete it
- you are using the IP driver in this .app (an update will be out today that removes its linking to clarunext
- you don't have or are not using the latest templates; core (EE) or PDF if running PE

Consistent, random GPFs? Rebuild all C9 binaries!

Bob Z got some attention with a posting in the newsgroups:

 Subject: consistent random GPFs

Note to all:

The FILE structure used internally changed in C9, so any 3rd party tool that works with FILEs must be rebuilt. If you use any 3rd party binary that works with FILEs (or your own binary) that wasn't rebuilt with the C9 compiler you can expect consistent random GPFs.

-

Robert

In other words, any code that declares a FILE structure must be rebuilt for C9.

But this only reinforces a previously stated maxim: **All binaries must be rebuilt for C9!**

The bit that got everyone's attention was "consistent, random GPFs."

Bob later indicated the changes are purely internal - no developer code needs updating (only recompiling). The structural changes were needed for future support for non-Latin characters.

Clarion 9's list box sorting

Clarion 9 appears to add support for list box sorting, so I decided to give it a whirl. '

The new bits I'm aware of are some properties:

```
PROPLIST:DefHdrTextColor EQUATE (7C2AH) ! integer: Text color in header
PROPLIST:DefHdrBackColor EQUATE (7C2BH) ! integer: Background color in header
PROPLIST:HdrSortTextColor EQUATE (7C2CH) ! integer: Text color in header of sort
column
PROPLIST:HdrSortBackColor EQUATE (7C2DH) ! integer: Background color in header of sort
column
PROPLIST:SortTextColor EQUATE (7C2EH) ! integer: Text color of sort column
PROPLIST:SortBackColor EQUATE (7C2FH) ! integer: Background color of sort column
PROPLIST:HasSortColumn EQUATE (7C30H) ! boolean: TRUE if sort column is supported
PROPLIST:SortColumn EQUATE (7C31H) ! integer: Current sort column
```

and a new event:

```
EVENT:HeaderPressed EQUATE (1FH)
```

I put together a small demo app:

```

                                PROGRAM

                                MAP
                                END

                                INCLUDE('equates.clw'),ONCE
DataQ                                QUEUE
Column1                                string(20)
Column2                                long
Column3                                string(20)
                                END
x                                LONG

MyWindow                                WINDOW('Caption'),AT(, ,336,285),GRAY,FONT('MS
Sans Serif',8,,FONT:regular)

BUTTON('&Close'),AT(287,262,36,14),USE(?CancelButton),LEFT

LIST,AT(15,8,307,243),USE(?LIST),VSCROLL,FROM(dataq),FORMAT('100L(2)|M~C' & |
                                'olumn 1~100L(2)|M~Column
2~100L(2)|M~Column 3~')
                                END

CODE

! Create some dummy data
loop 100 TIMES
    loop x = 1 to 20
        DataQ.Column1[x] = chr(random(65,122))
        DataQ.Column3[x] = chr(random(65,122))
    END
    Dataq.Column2 = random(1,10000)
    add(dataq)
END

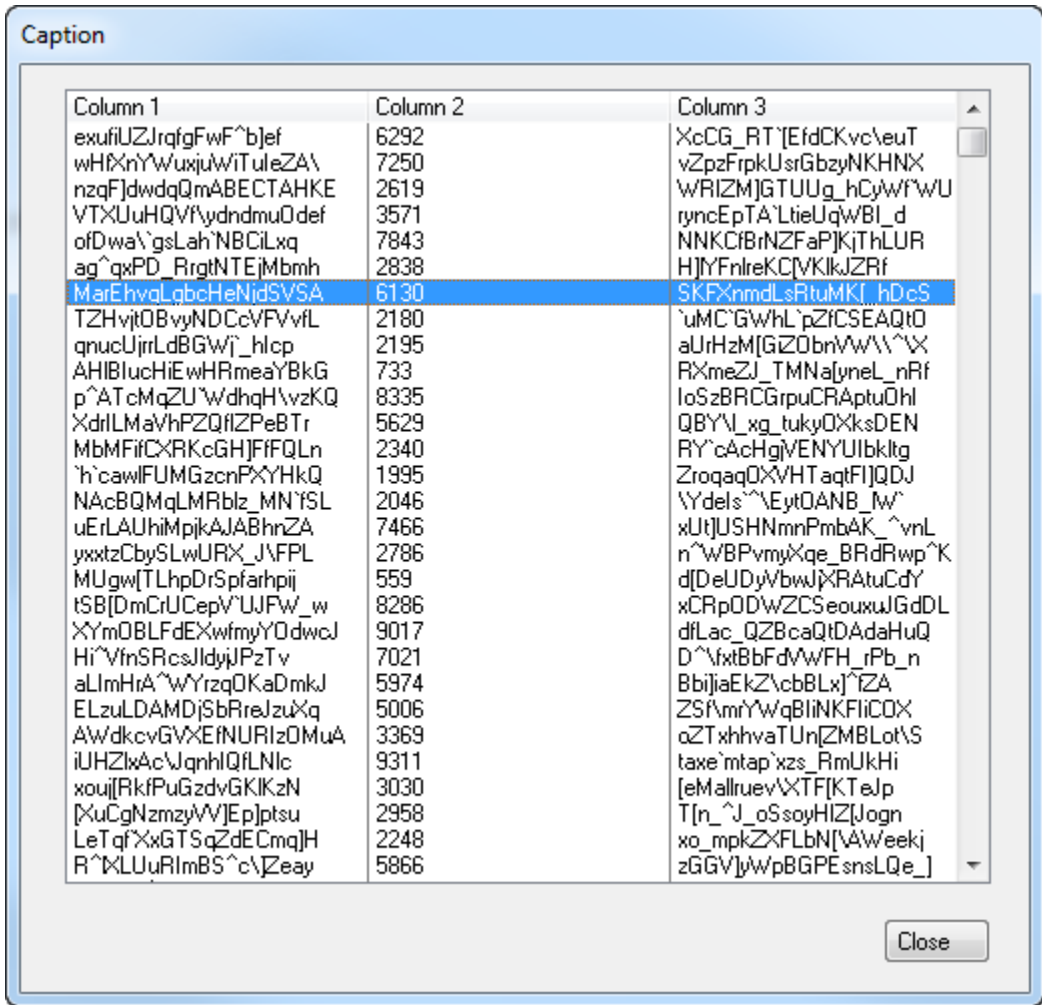

OPEN(MyWindow)
ACCEPT
    case event()
    of EVENT:HeaderPressed
        0{prop:text} = 'Current sort column: ' & ?list{PROPLIST:SortColumn}
    END

CASE FIELD()
OF 0
    CASE EVENT()
    OF EVENT:OpenWindow
    END
OF ?CancelButton
    CASE EVENT()
    OF EVENT:Accepted
        POST(EVENT:CloseWindow)
    END
END
END
END

```

I ran the app, but I didn't notice anything different about the list box. It didn't sort on columns or produce any header pressed events. For a moment I thought maybe I needed an IMM attribute, but of course that removes all of the built in event handling including scrolling, so I took it right back off again.

Here's the sample app:

Then I realized that I was missing the PROPLIST assignments in my code. I added them to the OpenWindow event handling:

```

CASE EVENT( )
  OF EVENT:OpenWindow
    ?list{PROPLIST:HasSortColumn,1} = true
    ?list{PROPLIST:HasSortColumn,2} = true
    ?list{PROPLIST:HasSortColumn,3} = true
  END

```

That triggered EVENT:HeaderPressed, but no automatic sorting. Well, that's not a big deal. I added this code:

```

case ?list{PROPLIST:SortColumn}
  of 1
    sort(dataq,dataq.Column1)
  of 2
    sort(dataq,dataq.Column2)
  of 3
    sort(dataq,dataq.Column3)
END

```

Presto - list box sorting:

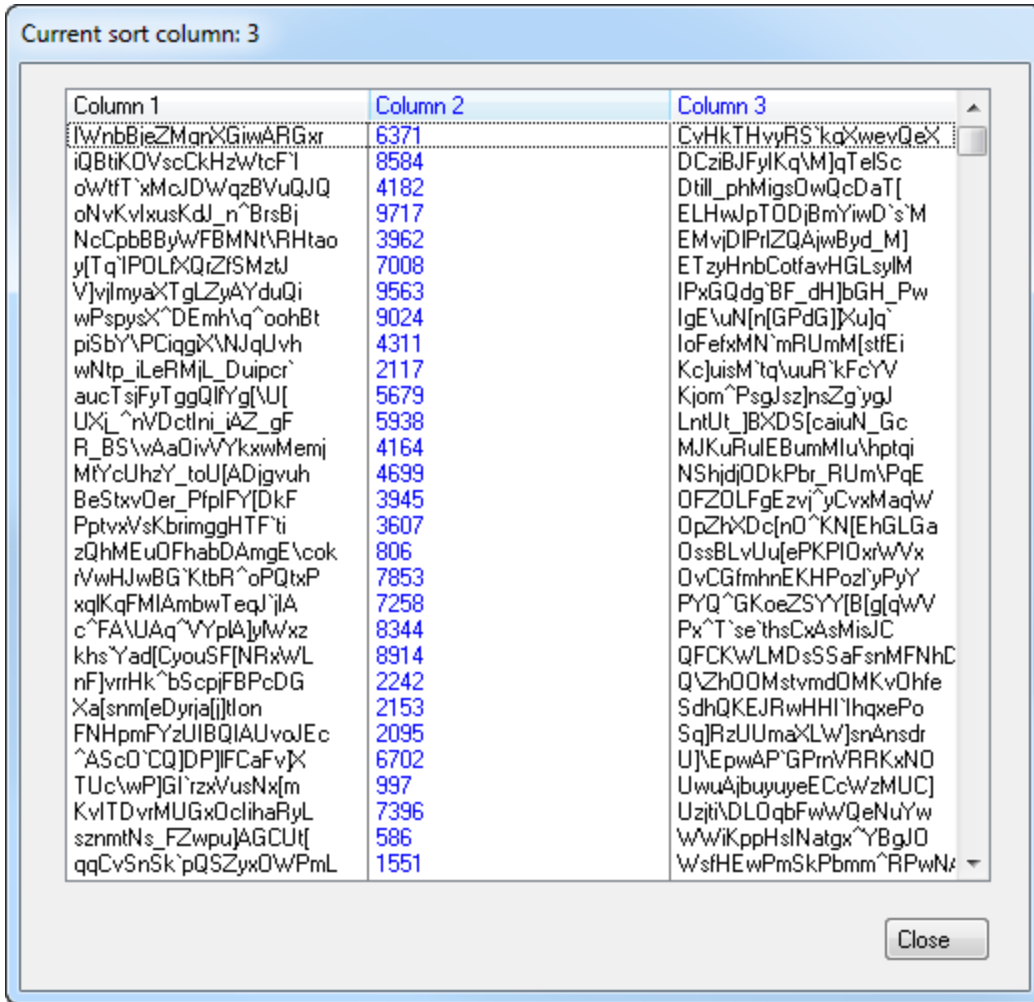

Current sort column: 3

Column 1	Column 2	Column 3

Close

I also added some code to set PROPLIST:HdrSortTextColor and PROPLIST:SortTextColor for visual clues.

But there are some oddities. Header coloring isn't always cleared when you select another column, and at the start all column headers are colored. Also the first click on a header changes the color, but the sorting doesn't happen until the second click, which can happen at any time after the first click (i.e. it's not a true double click). Here I've clicked on Column 2 but the sort order is still Column 3.

After playing around with this a bit more I realized that the problem is that PROPLIST:SortColumn doesn't return the column you just selected, it returns the column previously set as the sort column. Either there's a bug there or I'm handling the event wrong.

There doesn't seem to be any way internally to track the state of the sort order (i.e. if you want ascending/descending), so at present you'd need to do that in your own code. Also I don't see a means to add an image to indicate the sort order. There are ways to do that already, as [Randy Rogers](#) showed in [ClarionMag](#), but they're non-trivial.

While not a complete solution to sorting list boxes, Clarion 9 offers a good if slightly buggy start. I'd love to see a property for a sort order indicator image and some internal toggle tracking to go with it.

Here's the complete source for the sample Clarion 9 program:

```

PROGRAM

MAP
END

INCLUDE('equates.clw'),ONCE

DataQ
Column1          string(20)
Column2          long
Column3          string(20)
END

x                LONG

MyWindow        WINDOW('Caption'),AT(,,336,285),GRAY,FONT('MS
Sans Serif',8,,FONT:regular)

```

```

BUTTON(' &Close' ), AT(287,262,36,14), USE(?CancelButton), LEFT

LIST, AT(15,8,307,243), USE(?LIST), VSCROLL, FROM(dataq), FORMAT('100L(2)|M~C' & |
                                                                    'olumn 1~100L(2)|M~Column
2~100L(2)|M~Column 3~')

                                                                    END

CODE
loop 100 TIMES
  loop x = 1 to 20
    DataQ.Column1[x] = chr(random(65,122))
    DataQ.Column3[x] = chr(random(65,122))
  END
  Dataq.Column2 = random(1,10000)
  add(dataq)
END

Clarion 9 build 10094 release notes

Release Notes: C9.0.10094

Fixes/Features/Changes --- Alpha rel 2-----

FEATURE: Support for coloring the LIST control column headers and text (**this is a Work In Progress, UI refinements and template support to come**)

FEATURE: Support of PROPLIST:BarFrame, PROPLIST:HdrTextColor and PROPLIST:HdrBackColor properties in the ListBox control

FEATURE: Support of PROPLIST:BarFrame, PROPLIST:HdrTextColor and PROPLIST:HdrBackColor properties in the ListBox Format Editor

FEATURE: Support of Sort column in LIST controls

FEATURE: Add HT and HB modifiers to LIST format string to support column/group header's text and background colors

FEATURE: EVENT:HeaderPressed EQUATE (1FH)

FEATURE: new properties for the LIST control:

- PROPLIST:HdrSortTextColor EQUATE (7C2CH) ! integer: Text color in header of sort column
- PROPLIST:HdrSortBackColor EQUATE (7C2DH) ! integer: Background color in header of sort column
- PROPLIST:SortTextColor EQUATE (7C2EH) ! integer: Text color of sort column
- PROPLIST:SortBackColor EQUATE (7C2FH) ! integer: Background color of sort column

FEATURE: Added the ResetIDE.exe to the Tools->Options

FEATURE: Added specific toolbar items for Project, apps, resources.

FEATURE: ClaImg: Image Function to Rotate and Flip

FEATURE: ClaImg: Image Function to Save a Thumbnail image

FEATURE: WMFParser, Added the option to skip invalid external images in the processing of the WMF file (Set/Get SkipInvalidExternalImages)

CHANGE: Added some virtual methods to make it possible for the ReportTargetSelectorClass to be easily derived

CHANGE: Addins Manager now shows the installation path for the user installed addins

CHANGE: IDE Notification popups are now off by default

CHANGE: The ResetIDE tool will disable its options if the IDE is running

FIX: #GROUP name misspelling

FIX: Addins Manager was showing the .sdaddin extension in the installed addins dialog but the .sdaddin format is not supported

FIX: Addins Manager was not showing the user installed addins by default

FIX: Addins installed outside the Accessory directory were not displayed in the list of installed addins.

FIX: Clip rectangle could be incorrect sometimes on drawing a themed background

FIX: Drawing underscore for shortcuts under Win 8

FIX: File Drivers were not removed from the Driver Registry List

FIX: If you removed a file driver or synchronizer from the list of registered components, the component would reappear in the list the next time you started the IDE

FIX: Open via Redirection Form control layout

FIX: Opening a Solution in a different folder with the exact same name as the currently open Solution would reopen the existing Solution rather than the newly selected one

FIX: Sometimes when a PRAGMA is selected in a new CLW IDE might show a warning message

FIX: Sometimes an exception could trigger when closing the Solution, if while it is in the process of closing the user clicked on the .App in the Solution

FIX: The Report template was generating a call to GetSelected() instead of GetReportSelected()

PTSS 39880: Additional toolbar buttons on Solution Pad

PTSS 39882: #GROUP name misspelling: %WindowIsOneInstace

PTSS 39888: Open File via Redirection file dialog - Copy button not resizing.

PTSS 39888: Open File via Redirection file dialog - Copy button not resizing.

PTSS 39895: ReportTargetSelectorClass was doing a RETURN instead of a "Do ProcedureReturn" in the Clarion chain

PTSS 39902: Unable to register any Addins

Clarion 9 build 10125 release notes

Release Notes: C9.0.10125

Fixes/Features/Changes --- Alpha rel 3-----

FEATURE: Option to do automatic conversion of all applications in the current Solution (added to the App Conversion dialog)

FEATURE: Dictionary Editor: Added search for Modifications/Creation dates on any item

FEATURE: Dictionary Editor: Allow to do a search for all the DCT comments in every entity

CHANGE: Create SHEET controls with the WS_EX_TRANSPARENT style

CHANGE: Modified and Creation Date now display in the same format that is used internally to store them

CHANGE: Set the font for Window Designer errors to use the IDE Fixed Font size (8) to visualize the correct column of an error

CHANGE: report better errors when a an error is found in the REPORT/WINDOW structure

FIX: Current position in event queue could become incorrect if too many events are posted rapidly

FIX: DCT Editor, Column Editor was not showing properly some controls like the characters and places entry

FIX: DCT Search Form didn't open if the DCT was not in focus

FIX: Expand/Contract all nodes in the Data Pad didn't have the correct tooltip

FIX: Template generate embed responses must be removed after exit from the WINDOW/REPORT Designer

FIX: Window Designer error message was not read-only and the error wrapped over multiple lines

PTSS 39908: embed tree showing existing embeds as orphaned

PTSS 39930: POST's order disturbed

PTSS 39904: ImageEx Controls on Tabs not displaying

Clarion 9 build 10205 release notes

Changes from the last beta:

FEATURE: ABC Sort Headers Template - supports sort column colorization (Actions->BrowseBox Behavior->Extended Options)

FEATURE: Added the option to the Report Procedure template to open the Report Output after its generated

FEATURE: TopScan updated to use the C9 RTL

CHANGE: The DCT system no longer warns you about editing a .dct with unregistered file drivers if you open the .dct in read-only mode

CHANGE: Change ABC Sort header template uses the new PROPLIST:HasSortColumn property and the built-in support to sort on a headers click event

CHANGE: Change the message "Applications processed without errors: ({0})" by "Applications successfully processed: ({0})"

CHANGE: Change ABC Sort header template uses the new PROPLIST:HasSortColumn property and the built-in support to sort on a headers click event

CHANGE: Templates #PROMPT Color dialog now uses the new Color dialog (as used in the rest of the IDE)

FIX: The SQLite driver would lock up when doing LOGOUT of more than 1 file.

FIX: The blob-to-control extension template did not work properly when you used the resizer template

FIX: Error pad did not retain the currently selected error when focus was lost

FIX: Regression on checking for type Metafile in image conversion

FIX: Resolve Duplicated exports in Win32.Lib and ClaHTML.lib

FIX: SortHeader template code was alerting the MouseLeft key but that is not needed anymore with the support for EVENT:HeaderClick

FIX: The SQLite driver would lock up when doing LOGOUT of more than 1 file.

FIX: The focus rectangle was not drawn for themed CHECK and RADIO controls

Clarion 9 build 10241 discussion

Clarion 9 build 10241 is the first release of C9 to CSP program participants.

There was no change list included with the release email.

Speed improvements

Some devs are reporting significant speed improvements within the IDE,

Registry issues using C8 within C9

If you use C9 to host your C8 development (rather than installing each version separately, which is the default) then C9 will make your C8 registry unreadable from the C8 IDE, as the registry format has changed.

Problem generating/building DLLs

The IDE throws a generation error when creating code for DLLs. The app will build but as no EXP file is generated you can't use the DLL (at least not by linking in the DLL's lib). Diego says this will be fixed in the next build.

Update: Interim fix!

Bob Z has provided an interim fix for the DLL problem, which is caused by an incorrectly formatted Type32 node inside ClarionProperties.xml file.

This XML file is located in C:\Users\<username>\AppData\Roaming\SoftVelocity\Clarion\9.0 (where <username> is replaced with your own user name).

Here's how an incorrectly formatted file appears:

```
680     <MatchCase value="False" />
681     <MatchWholeWord value="False" />
682     <IncludeSubdirectories value="False" />
683     <IncludeReadOnlyBlocks value="True" />
684     <SearchStrategyType value="Normal" />
685     <LookIn value="C:\Users\Dave\Documents\Clarion Projects" />
686     <FindPatterns value="capitalize,y,private" />
687 </Properties>
688 <ICSharpCode.SharpDevelop.Gui.SearchAndReplaceDialog.Location value="783, 345" />
689 <SearchAndReplace.SearchResultPanelViewMode value="Flat" />
690 <Type32 />
691 <Properties name="Registry">
692     <Default_Width value="300" />
693     <Default_Height value="200" />
694     <MessageLines value="2" />
695     <Reregister_if_changed value="on" />
696     <Update_Template_Chain value="off" />
697     <Recreate_deleted_templates value="off" />
698     <EnableAssert value="on" />
699 </Properties>
700 </ClarionProperties>
```

The Type32 node should not exist. Instead it should be replaced by the following Properties node:

```
<Properties name="Type32">
    <signed value="long" />
    <unsigned value="long" />
    <handle value="long" />
    <bool value="long" />
</Properties>
```

This will be fixed for the next release, but meanwhile you can edit the file manually.

An extremely weird thing happened while I was editing my ClarionProperties.xml in Notepad++. I had copied the above text into the clipboard to paste into this document, and then to paste into the XML file. But I figured I should probably close Clarion first just in case it wrote to the file on exit. I closed Clarion. Notepad++ said the file had changed. Aha! I was right. I reloaded the file.

And to my great surprise it was now the correctly formatted file! How did that happen? Did what I had in the clipboard somehow make it into the file? That really doesn't make a lot of sense to me. Or did the IDE somehow wake up and realize it needed to rewrite the XML file?

Puzzling.

Start page styling

There's been some grumbling about a change to the IDE that internalized start page styling so it can no longer be customized via layout.css.

Can you ship product with this release?

At least one dev is shipping C9-built apps to customers with no reported issues.

SQLite driver

Not sure I completely understood the discussion, but it appears blob contents are not being copied as expected.

Report generator interface changes

There have been some changes to the report generator interface so if you have older source or an older version of a third party product that uses this interface you'll need to get the update or modify the source.

Possible duplicate symbols

Diego: "Most of the symbols from Win32ext.lib were merged with the Win32.lib in C9."

%Parameters is read only

In C9 there is only one prompt for prototypes (as there should be). Older templates that attempt to set the %Parameters value will trigger an error. In the old days Clarion code had labels in parameters and data types in prototypes. For years now it's been best practice to have parameters and prototypes declared exactly the same (except that for procedure/method implementations you have to leave off the return type if any, which seems pretty silly to me).

/ConfigDir

Graham Dawson has reported problems with Clarion not registering drivers when the /ConfigDir IDE switch is used.

Clarion 9 build 10274 release notes

Clarion 9 build 10274 has been released to CSP program participants. Fixes include:

FIX: #Suspend error when making a .DLL

The initial beta release could create an invalid setting in the ClarionProperties.xml file that would cause a #Suspend error and prevent making of .DLLs, due to a missing properties section of ClarionProperties.xml

The problem is fixed now in this release and that the section will get created properly, but to fix the _existing ClarionProperties.xml file you either have to:

Run ResetIDE.exe and choose option (4) - does not require re-entering your serial number, but clears IDE settings

- OR -

Open ClarionProperties.xml and manually edit/delete the section " <Type32 /> " (** if it doesn't exist then no action is needed)

- OR -

Manually delete the ClarionProperties.xml - - requires re-entering your serial number in the "invalid" section within ClarionProperties.xml file this section gets created as:
<Type32 />

in a correct/valid ClarionProperties.xml file its created as:

```
<Properties name="Type32">  
  <signed value="long" />  
  <unsigned value="long" />  
  <handle value="long" />  
  <bool value="long" />  
</Properties>
```

FIX: Exception on attempt to request entries from a missing properties section of ClarionProperties.xml

FIX: FrameExtension template was generating ASSERTS

FIX: If an OLE control was declared in a MDI child window that has a MENUBAR, the window's controls declared below the OLE control were created with the MDI frame as the parent

FIX: Midnight time converted from TIME to LONG incorrectly

FIX: Possible violation of heap consistency on changing picture of EIP entry control

FIX: Possible System.IndexOutOfRangeException exception

FIX: REMOVE(<file name>) worked for directories as well as for files and removed files recursively in nested directories without confirmation

FIX: Setting ' ' (0) to PROP:Right, PROP:Center, PROP:Decimal worked incorrectly for ENTRY controls

FIX: Thread should not be locked during execution of constructors and destructors

FIX: Too early call to thread's destructor could cause retrieving of incorrect thread structure

FEATURE: New REMOVE functionality; REMOVE(<filename>,<options>) statement with additional parameters to control removing of directories, processing of directories recursively, and showing progress and confirmation dialogs

CHANGE: Add EQUATE for the Vietnamese charset

CHANGE: If the compiler returns an exception, show the address of the compiler's entry point to better locate the GPF point

CHANGE: Update SystemString class to fix some potential problems

PTSS 39785: Co-operative threading hooks cause memory leaks and eventually an exception

PTSS 39980: REMOVE(file) can delete entire subtrees

Clarion 9 build 10294 release notes

SoftVelocity released Clarion 9 build 10294 on August 1 2013. Here are the release notes:

i FEATURE: You can now force dlls to be copied to the destination directory of the .exe using the LibAlwaysCopyList.xml file located in the <appdata>\SoftVelocity\Clarion\9.0 folder

CHANGE: DataBrowser: set a reasonable default picture for Memo fields, enable ESC key for Cancel of MemoEditForm

CHANGE: Update Application tree 'Sort By Date' icon

FIX: If you created/copied a local redirection file while a project was open, the context menu item "Edit Redirection File" accessed from the project node in the solution explorer would open the base redirection file rather than the new redirection file

FIX: If you deleted the local redirection file while a project was open, the context menu item "Edit Redirection File" accessed from the project node in the solution explorer would throw an exception

FIX: Appearance Editor was missing an example of the checkbox menu items

FIX: Changing the fonts directly from the TextEditor Options, or popup options was not preserved

FIX: File Options Dialog executed from the Context menu was not resizing properly

FIX: Icon for an embed with code was being truncated when the font size was smaller than the default

FIX: Incorrect index name used in the ASSERT for Frame Extension

FIX: Some Color themes used an incorrect color in the Checkbox menu items

PTSS 40069: IDE can freeze while picking color

PTSS 40081: SystemStringClass bug

PTSS 40034: global and local data alpha sorted

In comparing 10294 to 10274 I noticed the addition of some DLLs:

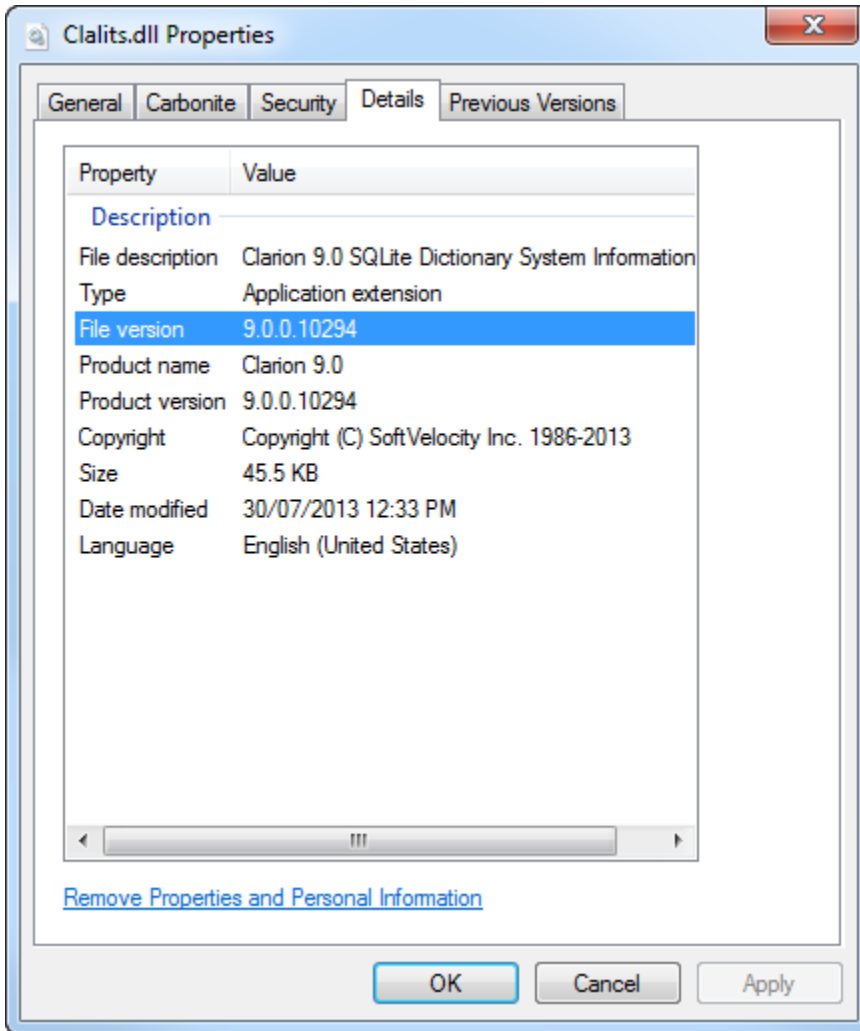

bin	136,971,548	01/08/2013 9:30:57 PM
Addins	27,139,216	01/08/2013 9:30:57 PM
BackendBindings	18,624,417	01/08/2013 9:30:55 PM
ClarionBinding	18,624,417	01/08/2013 9:30:55 PM
Common	18,280,304	01/08/2013 9:30:56 PM
SoftVelocity.Clarion.Runtime.Procedures.dll	847,872	30/07/2013 12:36:47 PM
SoftVelocity.Clarion.Runtime.Classes.dll	176,128	30/07/2013 12:36:04 PM
SoftVelocity.Clarion.FileIO.dll	147,456	30/07/2013 12:36:05 PM
log4net.dll	270,336	20/06/2009 1:51:42 PM
ICSharpCode.SharpDevelop.Dom.dll	266,240	30/07/2013 12:41:19 PM
ICSharpCode.NRefactory.dll	409,600	30/07/2013 12:41:12 PM
ICSharpCode.Core.dll	147,456	30/07/2013 12:41:18 PM
Clarion.Core.dll	73,728	30/07/2013 12:41:31 PM
Clalits.dll	46,592	30/07/2013 12:33:48 PM

Those back end bindings are Clarion.NET DLLs. Were they included accidentally? I looked around a bit more and discovered that the SoftVelocity.Clarion.* DLLs may be new to this directory, but they're also in the bin directory. In fact a number of Clarion.NET DLLs have been shipping for some time now even in Clarion 8, including:

- SoftVelocity.Clarion.ClarionCodeProvider.dll
- SoftVelocity.Clarion.Classes.dll
- SoftVelocity.Clarion.CompilerMessages.dll
- SoftVelocity.Clarion.Design.dll
- SoftVelocity.Clarion.FileIO.dll
- SoftVelocity.Clarion.Files.dll
- SoftVelocity.Clarion.LINQToFileProvider.dll
- SoftVelocity.Clarion.LINQToFileProviderNetDrv.dll
- SoftVelocity.Clarion.Procedures.dll
- SoftVelocity.Clarion.Runtime.Classes.dll
- SoftVelocity.Clarion.Runtime.Procedures.dll

Make of that what you will.

The one truly new file, Clalits.dll, is part of the SQLite support:

With the exception of one Assert statement in SystemString.clw, all of the changes from build 10274 are in the binaries.

Clarion 9 build 10309 release notes

beta 4 - Fixes/Changes/Features

FIX: Client area of non-MDI WINDOWS or APPLICATIONS with menubar resized on hiding
FIX: Status bar with height 0 created for WINDOWS/APPLICATIONS without STATUS attribute
FIX: IF LIST's font changed, styles defined after that used original font
FIX: CWTask was using the Environment.SpecialFolder.ApplicationData instead of the PropertyService.ConfigDirectory making the /Config param fail if using any folder other than the ApplicationData folder
FIX: On creating a new project from the app if the ClaRunExt.LIB was referenced it was asking for the project
FIX: Changing color in controls and pressing Enter Key or ESC Key was not behaving as expected
FIX: The Extended Colors Editor was not used when editing colors for the WINDOW or APPLICATION colors
PTSS 40103: Black flickering in some fields
IMPROVEMENT: Reduce visual defects on resizing themed windows with PROP:Buffer set to values other than 0

Clarion 9 build 10319 release notes

beta 5 - Fixes/Changes/Features

CHANGE: Move the App tree Mode buttons to the main ApGen toolbar
CHANGE: Adjust AppGen screen to reclaim unused space
CHANGE: IPserver.tpl: Clarunext.dll is now loaded at runtime so no need to link to the .LibFIX: DCT could not import a TXD/DCTX from a folder other than the DCT folder
FIX: PNG Images extension was not in the list of images to select
FIX: DESTROYing of a TAB control which has the TIP attribute and has been activated by mouse click could cause an error
CHANGE: Templates: Remove reference to unused file which forced the linking of the DOS driver

Clarion 9 build 10324 release notes

beta 6 - Fixes/Changes/Features

*** All binaries must be rebuilt; both your own and all 3rd party ***

CHANGE: change internal RTL version number:
(The RTL checks the value of the RTL version linked to every CW executable including CLARUN.DLL.
A version mismatch is reported if:
- EXE/DLL's <major version> is not equal to same as the CLARUN.DLL
- if its detected that an EXE/DLL is made with a Clarion version prior to C9.0.10234)

CHANGE: Adjust appgen screen to reclaim unused space
CHANGE: IPserver.tpl: Clarunext.dll is now loaded at runtime so no need to link to the .Lib
CHANGE: Move the App tree Mode buttons to the main appgen toolbar
CHANGE: Remove reference to unused file which is causing forced linking of the DOS driver to program
CHANGE: normalize AppTree button sizes
FIX: DCT could not import a TXD/DCTX from a folder other than the DCT folder
FIX: DESTROYing of TAB control which has the TIP attribute and has been activated by mouse could cause an error
FIX: Intermittent lockup of the IDE when "Unloading (AppName)"
FIX: PNG Images extension was not in the list of images to select
PTSS: 38289 unexpected result in case of Turkish as an ANSI codepage

Clarion 9 build 10332 release notes

 beta 7 - Fixes/Changes/Features

FEATURE: ABC: Added "Blank" and "All" options in the DropCombo template/class
FEATURE: ABC: Added "NoIcons" property to the PopupClass manager to allow displaying the popup menu without the icons
FEATURE: ROG: Added option to hide the Report output progress window

FIX: Importing tables into a .dct from multiple different SQL databases (or multiple SQLite db files) required restarting the IDE
FIX: SQLite: when attempting to browse a table in the IDE, and changing the selected DB file, the list of tables within the DB file was not refreshed
FIX: Using the ellipsis button next to the file name entry field on the SQLite selection dialog would not populate the file name into the entry field

CHANGE: Resize Control Strategies; Prompts resized and re-positioned

The following items from the build 10324 release notes were included in the build 10332 release notes:

```
*****
*** All of your binaries must be rebuilt; you need the updated versions of all SoftVelocity addon
products and you must also obtain the updated versions for any 3rd party DLLs that you use***
*****
*****

CHANGE: change internal RTL version number:
  (The RTL checks the value of the RTL version linked to every CW executable including CLARUN.DLL.
  A version mismatch is reported if:
  - EXE/DLL's <major version> is not equal to same as the CLARUN.DLL
  - if its detected that an EXE/DLL is made with a Clarion version prior to C9.0.10234)

CHANGE: Adjust appgen screen to reclaim unused space
CHANGE: IPserver.tpl: Clarunext.dll is now loaded at runtime so no need to link to the .Lib
CHANGE: Move the App tree Mode buttons to the main appgen toolbar
CHANGE: Remove reference to unused file which is causing forced linking of the DOS driver to program
CHANGE: normalize AppTree button sizes

FIX: DCT could not import a TXD/DCTX from a folder other than the DCT folder
FIX: DESTROYing of TAB control which has the TIP attribute and has been activated by mouse could cause
an error
FIX: Intermittent lockup of the IDE when "Unloading (AppName)"
FIX: PNG Images extension was not in the list of images to select

PTSS: 38289 unexpected result in case of Turkish as an ANSI codepage
```

Clarion 9 build 10371 release notes

```
/--- beta 9 Sep 12th ----- Fixes/Changes/Features
=====
FIX: App conversion and/or project refresh/creation could fail with the
message "unloading appname..." and lock the IDE
FIX: If an .App was closed with some project CLWs left open then the App was
re-opened, the IDE would try to re-load the CLWs and it could fail with a
StackOverflowException
FIX: ClarionCL command line was failing when generating apps
FIX: Toolbar control was not showing the Color Picker used in all other
controls for the BackColor
CHANGE: Changed name/use of C80TFT.INI to ClaTFT.INI
CHANGE: when the command line Generator is called without a version param it
is now set to the current version
FEATURE: Clarion chain: Added option to hide the Report Output progress
window
FEATURE: Added support to set the gradient color for TOOLBAR, BOX and PANEL
from the Actions dialog and to generate the required code
FEATURE: When populating a DIM field a popup dialog is presented to set the
array index number in the Designers (you can still set the array index
manually as before)
```

Clarion 9 build 10376 release notes (gold release)

```
/--- Gold release for Clarion 9 Sep 23rd ----- Fixes/Changes/Features
=====

FIX: Incorrect calculation of width of items of popup menus
FIX: The BASIC file driver would crash if you passed any invalid value to
the FIELDDELIMITER or ENDOFRECORD driver strings or the SEND command. Eg
SEND(file,'FIELDDELIMITER=|') instead of SEND(file,'FIELDDELIMITER=1,124')
PTSS 40181: BASIC driver crashes when using | as delimiter
PTSS 40132: Drop-Down Menus right margin fixed/too small
```

Clarion 9.1 with touch support coming soon

Today (Nov 22, 2013) Bob Zauere went on ClarionLive to give an update on the touch support coming in Clarion 9.1.

In general touch support is working "fantastic". The one thing that isn't working is drag and drop from images. List scrolling, inertia, all that is looking really good. Diego is testing from an Android tablet using Microsoft's RDP client.

Mike asked about keyboard popup on going to an entry field. Z thinks that could be coded but there is no automatic association in the API. Mike observed this does happen in RT apps but not in Windows touch apps.

The wizards will get an option to create touch style apps with larger buttons etc.

There are a couple of mostly-empty repositories on GitHub:

<https://github.com/softvelocity/clariontouch>

<https://github.com/softvelocity/Tiles>

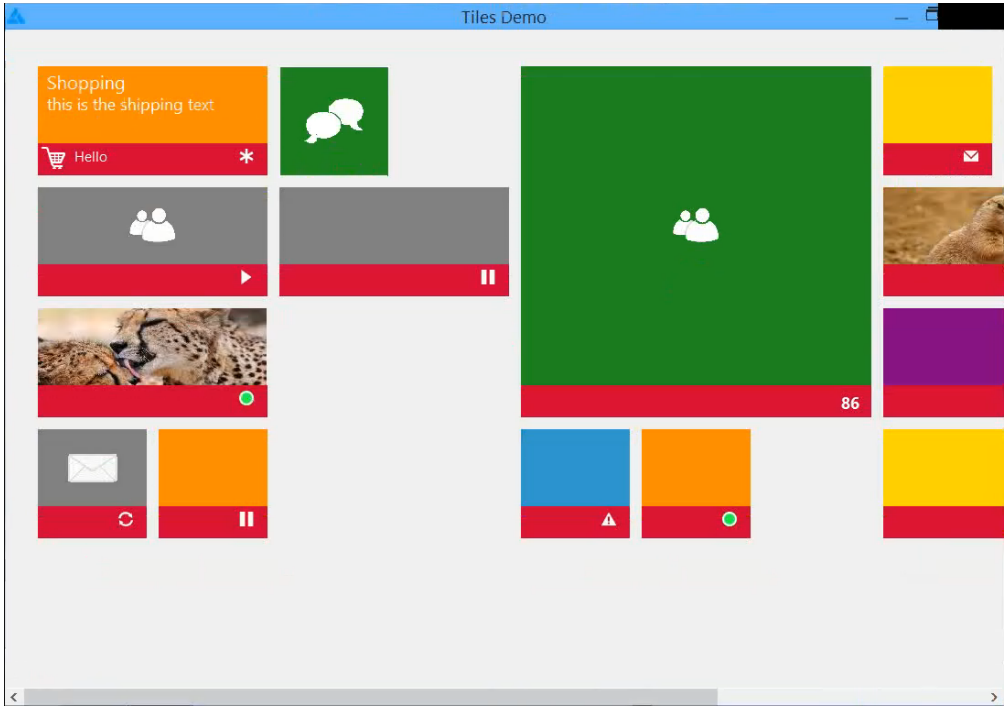

There will also be one for the X-Buttons functionality Bob showed at DevCon.

The IDE has been 90% ported to .NET 4.

There is a new SV web site under development. This has a gallery section for screen shots of best-looking apps.

Repositories will also be up on BitBucket.

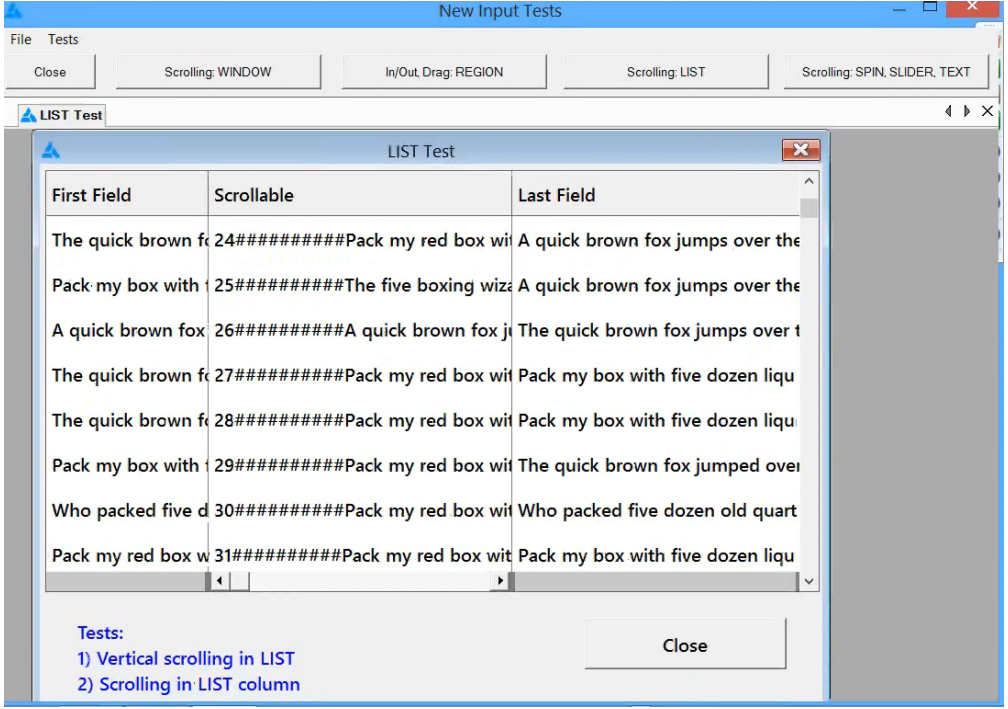

Diego showed the TileDemo app which uses some new classes.

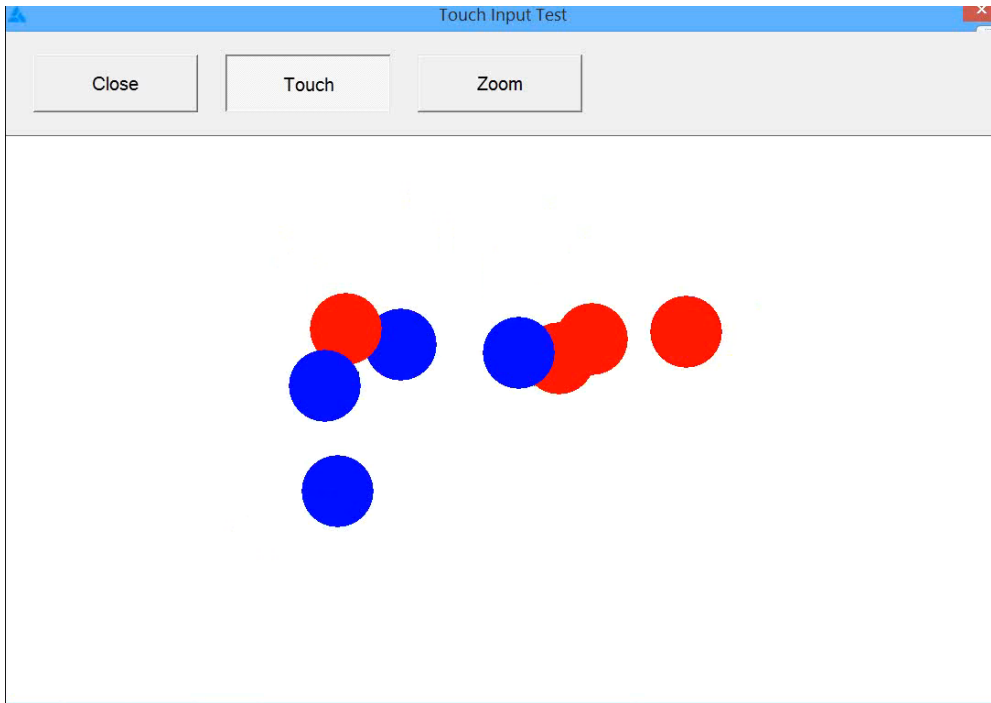

Changing of background images is still a work in progress.

The TileGroupClass handles automatic repositioning of the tiles. Mike asked about letting the user move tiles around; this functionality could be added. As for displaying an OCX on a tile, not currently supported but you could probably handle this with a derived class that uses the tile location as the specification for where to show the OCX.

The touch demo showed some basic touch functionality, including scrolling by swiping the list box and the expected inertia effect.

Diego also demonstrated the use of some other controls, all of which worked without any additional code. You can also go way beyond simple touch-enabling (simply by recompiling in 9.1) by detecting touch, gestures etc.

Clearly there's lots of good stuff to come!

Clarion 9.1 First Look

Clarion 9.1 build 10638 has gone out to third party vendors. As has been noted previously, the two big items in this release are touch support and reg-free COM.

There are two main things to note about touch support.

1. All apps automatically have touch support, including the ability to scroll a browse with a swipe gesture, and
2. If you need extended touch support (e.g. gestures) all of that is available as well.

I don't have a usable tablet handy at the moment so I can't yet give my first impressions of the touch support, but on January 17 Mark Goldberg gave a fairly lengthy [ClarionLive presentation on touch support](#) which included a camera view of his Surface Pro tablet.

I'll take a look at reg-free COM support next time, but the key point is that as with touch support, this functionality is there automatically, with the proviso that the COM object is in a *side by side assembly*. That is, the COM object's DLL must have an appropriate manifest file, so I imagine there may be some growing pains as Clarion developers attempt to deploy a variety of COM objects with their apps.

Release notes

The release notes are as follows - I'll touch on a number of the release note points as I look at the changes in the installed files.

Release notes
<ul style="list-style-type: none">• FEATURE:: Support of Touch input• FEATURE:: Support registration-free activation of COM objects from side-by-side assemblies• FEATURE: Added support for routines in DCT triggers code. NOTE: Restrictions: the routines name should not start with the word "routine" (will make the code generate incorrectly). After the first routine is found the rest of the code will be treated as routine code and output in column 1 after the RETURN of the method• FEATURE:: Added two new methods to the resize class to know when resizing starts and finishes: WindowResizeBegin and WindowResizeEnd

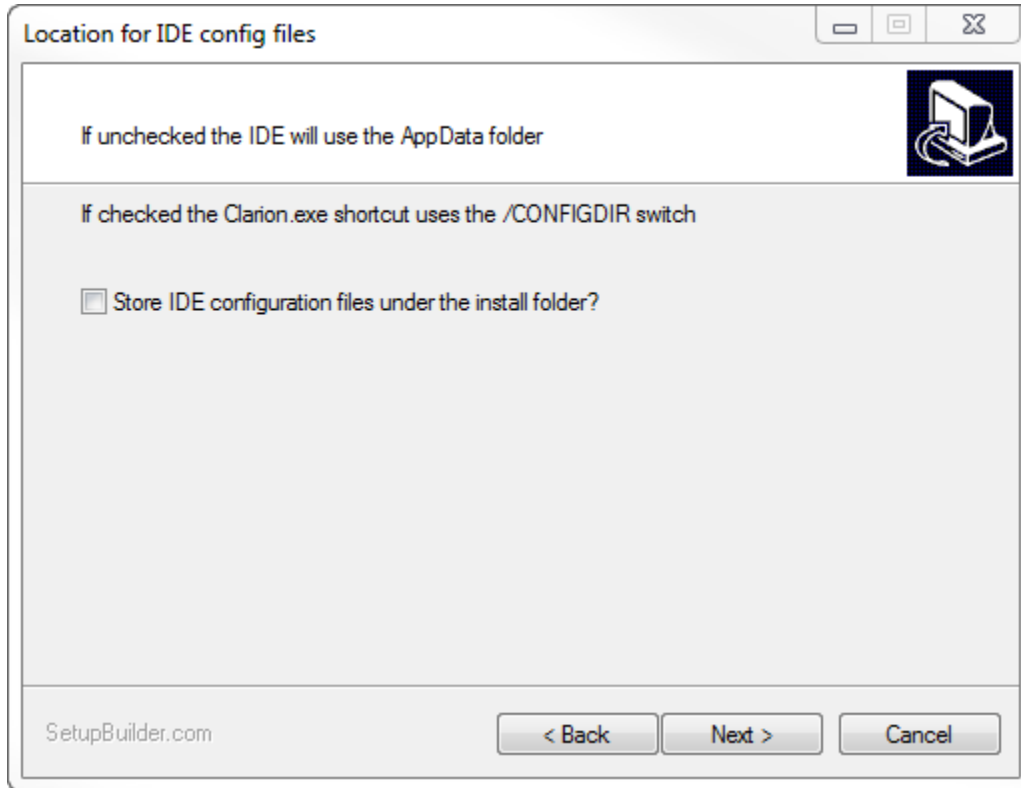

- FEATURE:: Before building if the process CCC.EXE is found running the IDE will try to stop it, if is successful it will add a message in the Error List (Message) This was added to stop the error on building related to the Catalyst Control Center Utility (aka CCC.EXE)
- FEATURE:: Files for custom handling of touch input in programs; CWTOUCH.CLW, CWTOUCH.INC, CWTOUCHDEF.INC
- FEATURE:: JSON: Added an example that show how to serialize and deserialize a QUEUE to/from json
- FEATURE:: JSON: Added methods to the JSON Class to parse the Json results
- FEATURE:: JSON: Allow to use a PICTURE to format numbers in the ToJSON groups and queue and to DEFORMAT the numbers with @BOOL support
- FEATURE:: JSON: class Added methods to the JSON class to parse the json string and retrieve the names , values (simple or arrays) of a json pair
- FEATURE:: JSON: class Added methods to the JSON class to deserialize GROUPs and QUEUEs
- FEATURE:: Option setting to set the length of the Clarion code Editor line before adding a &|Tools-Options-TextEditor-Clarion Specific Options NOTE: for now this only apply to the hand coded Windows (Ctrl+D), not the App windows
- FEATURE:: QuickXMLParser added Trace method that is called every time the parser executes an interface method. (use OutPutDebugString)
- FEATURE:: Send Email and Send SMS functions added to ClaRunExt
- FEATURE:: Setting to enable to automatically kill the process (App's Exe) before doing a build (only available on EE) Options-General-Project and Solutions-"Kill Process before build"
- FEATURE:: Show info about address in the call stack in form <module name>:<offset> if module has no debug info or address can't be resolved
- CHANGE: Extend sizes of variables used to hold a procedure's prototype and parameter list
- CHANGE: ABC Browse Class, method ReplaceSort is now virtual
- CHANGE: ABC: Added support to the WindowExtenderClass to check if a processes other than the current one is running and be able to bring them to the front
- CHANGE: ABC: Added support for Only one Instance of the procedure when the procedure is declared in a DLL
- CHANGE: Added support to the GENERATEDClass module and SourceClass procedure template to generate generic members
- CHANGE: Additional functions of the i64 family
- CHANGE: Default vale for the DCT QuickView is Advanced before it was Simple
- CHANGE: Default value to Require Dictionary is set to false
- CHANGE: Fields of type reference-to-typed-GROUP are allowed now in structures
- CHANGE: ICSharpCode.SharpDevelop.Gui.FormLocationHelper is deprecated, please use ICSharpCode.Core.FormPositionService.Instance instead.
- CHANGE: IListControl new method GetSelectedItem
- CHANGE: If the selection of the derived from column creates an error now the error is displayed in the error pad
- CHANGE: Improve the Parser Thread start/stop process
- CHANGE: Old default properties were not matching the name of the properties files used by the IDE.
- CHANGE: Old files named SharpDevelop-teplates.xml was renamed to CodeSnippets.xml to easily identify it with the options it store
- CHANGE: Set message text for constraint type run-time errors; 401: "Stack overflow", 402: "Null pointer de-reference", 404: "Arithmetic overflow", 405: "Value out of range", 406: "No return from function", 407: "No matching case label", 408: "Division by zero", 409: "Index out of range"
- CHANGE: Solution Explorer (Clarion Project), when an item from the solution like a Icon, CLW, etc. is removed the previous item is now selected instead of going to the parent node
- CHANGE: Support Windows 8.1 in the MANIFEST command for the linker
- CHANGE: SystemString class: Format method is renamed to FormatString
- CHANGE: The font for the TopSpeed ODBC driver dialogs has been changed to be consistent with the rest of the product
- CHANGE: Update ClaTalk template to use the ClaRunExtClass
- CHANGE: Updated the IPEXEC parameter parser to use equates for the states (faster than strings)
- CHANGE: When Controls in the DCT are created (WINDOW/REPORT field representations) the Parser was re-reading the EQUATES.CLW and BUILTINS.CLW files from disk, now it caches those files after the first read. NOTE: If a user is modifying those files the changes will not be reflected until the IDE is re-started. NOTE2: If the user is using multiple EQUATES.CLW or BUILTINS.CLW files from multiple .Red files only the first one used will be processed for the DCT Control creation and Code Completion.
- FIX: Procedure parameters could be imported wrong from a partial TXA (TXA having no [APPLICATION] section)
- FIX: AppBrokerServiceManager was not showing the correct icon when the service was stopped
- FIX: Clicking on the cancel button during DCT conversion or other Dct process was not stopping the process but just closing the window dialog
- FIX: Code Completion was differentiating between upper case and lower case file name extension.

- FIX: DCT: Sometimes when the Column contained invalid data, selecting a new columns could cause a null exception based on the invalid data
- FIX: DCT: When any validation error happen on a derived column and the child is selected, the error was not displayed
- FIX: DCT: when converting the DCT and an expected error happen, the error were only added to the Pad but not displayed in a Message()
- FIX: Fix typo in the Icon viewer
- FIX: GET(file,key) did not work with the SQLite driver if the key components where not the first fields in the record structure
- FIX: Generator did not generate &REPORT fields correctly
- FIX: Horizontal scrolling by touch in LIST controls did not work
- FIX: If an invalid shortcut was found at startup the IDE would shut down
- FIX: If there was an error in a redirection macro in an included redirection file, then the dialog displaying the error message indicated that the problem was in the top level redirection file rather than in the included redirection file.
- FIX: Incorrect text was displayed in the Toolbar Build Solution and Rebuild Solution buttons
- FIX: PNG images with an alpha channel would not 'stretch'
- FIX: Position of scrollable WINDOW or IMAGE control could be calculated incorrectly on scrolling or on changing the PROP:XOrigin or PROP:YOrigin properties
- FIX: Possible memory leaks if LIST control uses styles
- FIX: REGION, PROMPT, RADIO controls were not using the correct Color Editor in the Window Designed for some color properties
- FIX: REPORT Format Section Dialogs were not using the correct color dialog
- FIX: REPORT parts were not using the correct Color Dialog for the color properties
- FIX: Reference assignments of NULL to variables of type &GROUP or &GroupType produced unwanted statics
- FIX: Separator was spelled incorrectly in the TopSpeed ODBC driver configuration dialog.
- FIX: Setting PROP:HScroll and PROP:VScroll to TRUE for an IMAGE control caused displaying of scrollbar even if its real size is not enough to fill the control rectangle
- FIX: Shortcut editor allowed for invalid shortcuts to be added to the IDE
- FIX: Size of fields for Justification and Place Over in the DCT were too small
- FIX: Some IDE dialogs were not re-displaying and positioned properly after were displayed in a secondary display that was unplugged
- FIX: Sometimes the Close All Documents command will not close all the open Documents.
- FIX: Sometimes the Code Completion will not work if a , is used in the last position of a line
- FIX: The DCT Editor allow to create a field derived from other field that could create a recursive list of parents
- FIX: The build system could use the wrong redirection file if there were multiple projects in a solution and those projects were in different folders and there was a clarion90.red file in each of those folders
- FIX: The first time you did a generate in the IDE the creation of the exp file might not work properly
- FIX: The redirection system was not parsing the %THISDIR% macro correctly when doing a build
- FIX: TopSpeed driver would leak memory if you used the TableList SEND command
- FIX: Topscan: Default text of the column header could be built incorrectly
- FIX: Topscan: Incorrect column picture could break displaying of data
- FIX: Topscan: Possible assert failure on the browsing file for the first time
- FIX: Unexpected errors could occur on compile/link time if the name of a File View object clashes with the name of some user declared object
- FIX: Upgrading of pre-C7 apps could lose the generated flag from project items
- FIX: When a severe error happens during generation of the App sometimes the Build process would start but it could not be stopped, leaving the IDE in an state that needed shutdown
- FIX: When accessing Btrieve files that had a PDECIMAL field in them that was a key component of a key with the OPT attribute, if you did a binary level compare (eg SavedRecord = Record), this would sometimes fail. DOCUMENTATION: Update the Btrieve docs to document the NULLPDECIMALS = ON|OFF driver string.
- FIX: When there is a template that was missing the generation from the application pad could generate an exception and shutdown the IDE
- FIX: When there is a template that was missing the generation of the App from the Application Pad could generate an exception and shutdown the IDE
- FIX: You could create a local variable of type REPORT via the data pad. The data pad now restricts you to creating variables of type &REPORT
- PTSS 34503: IPDVR - IPEXEC function parameters can not contain a ')'
- PTSS 40060: EDITOR HANGS - with specific sequence of lines removed, (code folding could not identify the parent)
- PTSS 40093: - JSON Class ToJSON() returns a badly formatted JSON string
- PTSS 40205: Clarion Chain Report Previewer zoom was not working over the image
- PTSS 40233: TopSpeed 5.0 driver Prompt Screen issues
- PTSS 40267: Missing references after the import of the Clarion 6.3 app
- PTSS 40342: AbSql.clw: renamed label TextFile to SV_SqlScriptFile to avoid clashing with common user labels

- PTSS 40406: REPORT reference goes haywire
- PTSS 40487: TXA import thrashes Parameters Entry
- REGRESSION: Adding a file to a project that could not be found via redirection added only the file name rather than the relative path to the file

Install program changes

During the install process I noticed this window, which I don't recall seeing in 9.0:

This isn't new functionality - in Clarion 8 you can already use the /CONFIGDIR switch, but it's nice to see the install program updated to set that switch up for you.

Installed file changes

On the binary side there are no doubt numerous changes, but it's difficult to tell what they are from a file comparison. There is however a new executable called ClaRunExtSetup.exe.

This file is related to the the Report to PDF template's Scan Copy Mode option, which lets you create scannable PDFs. From the help:

Use Scan Copy Mode

This option supports use of any image format and any font. The WMF pages are converted to PNG so the resulting PDF is an exact copy.

** System Requirements

1. If you use this option you must deploy ClaRunExt.dll (located in the BIN folder).
2. The systems where this is deployed must have the Microsoft VC++ (x86) 2005 runtime installed
3. The systems where this is deployed must have the Microsoft .Net Framework 2.0 runtime installed

Both of these requirements can easily be installed using SetupBuilder, or with the ClaRunExtSetup.exe that can be found in the Clarion BIN folder.

This subject has been previously covered - see [Clarion 9 apps using Report to PDF to require C++ redistributable?](#) where Bob Z mentions this executable as coming in 9.1

ClaRunExt.DLL is still present in 9.1, but ClaRunExt.lib has gone away. ClarunExt.INC has changed to include a class definition with methods for image manipulation and sending SMS and mail (there is a new ClaRunExt.CLW to match):

```
ClaRunExtClass
CLASS,TYPE,MODULE('ClaRunExt.clw'),LINK('ClaRunExt.clw',_ABCLinkMode_),DLL(_ABCDllMode_)
Inited          BYTE,PROTECTED
Construct       PROCEDURE()
Destruct       PROCEDURE(),PROTECTED
Init           PROCEDURE(),BYTE,PROTECTED
ImageToPNG     PROCEDURE(CONST *CSTRING fileNameIn),LONG!Save image to a PNG
file, changing the fileName extension to PNG. Return 0 if no error and Error Number if
there is an error
ImageToPNG     PROCEDURE(CONST *CSTRING fileNameIn, CONST *CSTRING
fileNameOut),LONG!Save image to a PNG file with the name fileNameOut. Return 0 if no
error and Error Number if there is an error
ImageRotateFlip PROCEDURE(CONST *CSTRING fileNameIn, CONST *CSTRING
fileNameOut, LONG RotateFlipType),LONG!Save image rotated or flipped. Return 0 if no
error and Error Number if there is an error
ImageSaveThumbnail PROCEDURE(CONST *CSTRING fileNameIn, CONST *CSTRING
fileNameOut, LONG percentage),LONG!Save image reduced in size. Return 0 if no error
and Error Number if there is an error
SendSMS       PROCEDURE(CONST *CSTRING SMTPServerHost, CONST *CSTRING
SMTPLoginUserName, CONST *CSTRING SMTPLoginPassword, LONG SMTPPort, LONG
SMTPEnableSsl, LONG showErrorMessage, CONST *CSTRING fromAddress, CONST *CSTRING
toPhoneNumber, CONST *CSTRING toCarrier, CONST *CSTRING subject, CONST *CSTRING
textMessage),LONG
SendMail      PROCEDURE(CONST *CSTRING SMTPServerHost, CONST *CSTRING
SMTPLoginUserName, CONST *CSTRING SMTPLoginPassword, LONG SMTPPort, LONG
SMTPEnableSsl, LONG showErrorMessage, LONG receiveRequest, CONST *CSTRING
messageBodyEncoding, CONST *CSTRING fromAddress, CONST *CSTRING toAddress, CONST
*CSTRING replyToAddress, CONST *CSTRING subject, CONST *CSTRING htmlMessage, CONST
*CSTRING embeddedImageFileNames, CONST *CSTRING textMessage, CONST *CSTRING
attachedFileNames),LONG
                END
```

The new class file is also interesting because it prototypes the various API calls needed for dynamically loading DLLs and uses them to call the functions in ClaRunExt.DLL.

In ABBrowse there is a new GetSelectedItem method in the IListItemControl interface. This is used in GridClass.

FileDropClass has two new methods, IncludeEmpty and IncludeAll, and a new TextForAll property.

PopupClass gets new SetNoIcons and GetNoIcons methods.

There is a new ShowOutputProgress property on PrintPreviewClass which is used to optionally hide the progress window.

WindowResizeClass gets two new methods: WindowResizeBegin and WindowResizeEnd.

New touch source files

There are a number of new source in this 9.1 release. Three of these are for touch support:

```
CWTOUCH.CLW
CWTOUCH.INC
CWTOUCHDEF.INC
```

CWTouch.inc includes the following classes:

- InputPoint
- TouchPoint
- InputData
- TouchData

These classes are primarily data but each has a Next() method which, somewhat mysteriously, only returns NULL.

The following COM interfaces are also defined:

- IGestureResponder
- IPointerResponder
- ITouchNotifier

New H5 source files

There are no H5 templates in this release, but I'm told good progress is being made on the H5 project. There are however a number of new H5-related source files:

- H5BROKER.CLW, H5BROKER.INC
- H5CLIENT.CLW, H5CLIENT.INC
- H5CNTRLS.CLW, H5CNTRLS.INC
- H5EVENT.CLW, H5EVENT.INC
- H5FILES.CLW, H5FILES.INC
- H5HTML.CLW, H5HTML.INC
- H5HTTP.CLW, H5HTTP.INC
- H5JSL.CLW, H5JSL.INC
- H5LAYOUT.CLW, H5LAYOUT.INC
- H5REPORT.CLW, H5REPORT.INC, H5REPORT.TRN
- H5SERVER.CLW, H5SERVER.INC, H5SERVER.TRN
- H5SINK.INC,
- H5STD.CLW, H5STD.EQU, H5STD.INC
- H5TXTOUT.CLW, H5TXTOUT.INC
- H5UNAUTH.HTM
- H5WINDOW.CLW, H5WINDOW.INC, H5WINDOW.TRN

If you're looking to put some meat on those bones, here's the current class list:

```

BrokerClass                CLASS(WebDataSinkClass)
BrowserManagerClass        CLASS
HtmlClass                  CLASS(TextOutputClass),TYPE
HtmlFontClass              CLASS,TYPE
HtmlItemClass              CLASS,TYPE
HttpBaseClass              CLASS
HttpClass                  CLASS(HttpBaseClass)
HttpPageBaseClass          CLASS
HttpPageBrowserClass       CLASS(HttpPageBaseClass)
HttpPageJavaClass          CLASS(HttpPageBaseClass)
JslEventsClass             CLASS
JslManagerClass            CLASS,TYPE
LayoutCellClass            CLASS,TYPE
LayoutHtmlClass            CLASS,TYPE
RangeClass                  CLASS,TYPE
ReportImageClass           CLASS(ReportItemClass),TYPE
ReportItemClass            CLASS(HtmlItemClass),TYPE
ReportStringClass          CLASS(ReportItemClass),TYPE
ShutDownClass              CLASS
SubmitItemClass            CLASS
TextOutputClass            CLASS,TYPE
WebAreaClass                CLASS(WebControlClass),TYPE
WebButtonClass             CLASS(WebControlClass),TYPE
WebCaptionClass            CLASS(WebAreaClass),TYPE

```

WebClientAreaClass	CLASS(WebAreaClass),TYPE
WebClientManagerClass	CLASS(WebClientManagerInterface)
WebClientManagerInterface	CLASS(WebDataSinkClass)
WebControlClass	CLASS(HtmlItemClass),TYPE
WebControlListClass	CLASS,TYPE
WebDataSinkClass	CLASS
WebFilesClass	CLASS
WebFrameClass	CLASS,TYPE
WebHotlinkClass	CLASS(WebControlClass),TYPE
WebHtmlButtonClass	CLASS(WebButtonClass),TYPE
WebHtmlCheckClass	CLASS(WebControlClass),TYPE
WebHtmlCloseButtonClass	CLASS(WebControlClass),TYPE
WebHtmlEntryClass	CLASS(WebControlClass),TYPE
WebHtmlGroupClass	CLASS(WebControlClass),TYPE
WebHtmlImageClass	CLASS(WebImageClass),TYPE
WebHtmlItemClass	CLASS(WebMenuBaseClass),TYPE
WebHtmlListClass	CLASS(WebListClass),TYPE
WebHtmlMenuClass	CLASS(WebMenuBaseClass),TYPE
WebHtmlOptionClass	CLASS(WebControlClass),TYPE
WebHtmlPromptClass	CLASS(WebControlClass),TYPE
WebHtmlRadioClass	CLASS(WebControlClass),TYPE
WebHtmlRegionClass	CLASS(WebControlClass),TYPE
WebHtmlSheetClass	CLASS(WebControlClass),TYPE
WebHtmlStringClass	CLASS(WebStringClass),TYPE
WebHtmlTabClass	CLASS(WebControlClass),TYPE
WebHtmlTextClass	CLASS(WebControlClass),TYPE
WebImageClass	CLASS(WebControlClass),TYPE
WebJavaListClass	CLASS(WebListClass),TYPE
WebjQueryButtonClass	CLASS(WebControlClass),TYPE
WebjQueryCloseButtonClass	CLASS(WebHtmlCloseButtonClass),TYPE
WebjQueryListClass	CLASS(WebListClass),TYPE
WebjQueryStringClass	CLASS(WebStringClass),TYPE
WebjQueryToolButtonClass	CLASS(WebjQueryButtonClass),TYPE
WebListClass	CLASS(WebControlClass),TYPE
WebLiteralClass	CLASS(WebControlClass),TYPE
WebMenubarClass	CLASS(WebAreaClass),TYPE
WebMenuBaseClass	CLASS(WebControlClass),TYPE
WebNullControlClass	CLASS(WebControlClass),TYPE
WebPageClass	CLASS(WebControlClass),TYPE
WebReportClass	CLASS,TYPE
WebServerClass	CLASS
WebStringClass	CLASS(WebControlClass),TYPE

```

WebToolBarClass          CLASS(WebAreaClass),TYPE
WebWindowBaseClass      CLASS(WebControlListClass),TYPE
WebWindowClass          CLASS(WebWindowBaseClass),TYPE

```

There have been some minor changes to the InternetConnect classes but I don't know if they're related to the H5 project.

The JSON class has a few new methods for string parsing.

Other source changes

There are some new properties:

```

PROP:Locale             EQUATE(7A76H) ! integer: SYSTEM or FILE LCID value
PROP:Codepage           EQUATE(7A77H) ! integer: SYSTEM or FILE codepage value
PROP:NoFont             EQUATE(7A78H) ! boolean:
PROP:TouchInterface     EQUATE(7A79H) ! integer: get the interface to touch input

```

The QuickXMLParser (actually XMLParser) now has some debugging methods.

I've never used the XMLParser class, but the source comments suggest that this is a SAX-type parser that steps through the XML and fires an event for each node it encounters:

```

! CLASS: XMLParser
!This is a none validate XML parser
!It is fast and use very low memory
!It can be very handy to parse trusted files that are valid
!The parser does not store or create any structure with the XML data
!instead it use an interface and call each method of that interface
!passing the XML Data.
!To use the parser the IXmlNotify need to be implemented.

```

Template changes

External procedures now have the "Only One Instance Allowed of the Procedure" prompt. The File Drop template adds prompts for "Include Blank Choice" and "Include 'All' Choice".

There are some new trigger embed points.

There's a new port template prompt to let you hide the output progress window.

You can now optionally generate modules as generic, with an empty Member() statement.

The UserControlClass procedure template now has this comment:

```

#! This control template is for testing only and not supposed to be the final version
(WIP)
#PROCEDURE(UserControlClass, 'UserControlClass', 'ClarionOOP'), WINDOW, PARENT(SourceClass
(ABC))

```

SoftVelocity [announced the UserControlClass](#) template at DevCon 2013, describing it as a template that lets you create a control or set of controls which are then wrapped up in a class for use in any other window. This has a lot of promise, but probably wouldn't be as widely used as H5 or touch support at least in the near term, which may be why it doesn't seem to have a higher priority.

There are some new gradient color prompts for windows and fields.

The ClaTalk.tpl template, which adds various kinds of support for email and SMS, is missing from my 9.1 install; perhaps this is an oversight.

Usually when I go through release changes I come across existing code I never knew existed. One such is `tutil.tpw`, which contains a code template called `CreateAtFromEmbed` that does exactly what you'd think - you drop it into an embed point and it generates commented-out template code that you can use in your own templates. Nifty.

Clarion 9.1 build 10638 release notes

```
/--- Beta release for Clarion 9.1 --- Jan 14 ----- Fixes/Changes/Features---/
*****
9.1
*****
FEATURE:: Support of Touch input
FEATURE:: Support registration-free activation of COM objects from
side-by-side assemblies
FEATURE: Added support for routines in DCT triggers code.NOTE: Restrictions:
the routines name should not start with the word "routine" (will make the
code generate incorrectly). After the first routine is found the rest of the
code of will be treated as routine code and output in column 1 after the
RETURN of the method
FEATURE:: Added two new methods to the resize class to know when resizing
starts and finishes: WindowResizeBegin and WindowResizeEnd
FEATURE:: Before building if the process CCC.EXE is found running the IDE
will try to stop it, if is successful it will add a message in the Error List
(Message) This was added to stop the error on building related to the
Catalyst Control Center Utility (aka CCC.EXE)
FEATURE:: Files for custom handling of touch input in programs; CWTOUCH.CLW,
CWTOUCH.INC, CWTOUCHDEF.INC
FEATURE:: JSON: Added an example that show how to serialize and deserialize
a QUEUE to/from json
FEATURE:: JSON: Added methods to the JSON Class to parse the Json results
FEATURE:: JSON: Allow to use a PICTURE to format numbers in the ToJSON
groups and queue and to DEFORMAT the numbers with @BOOL support
FEATURE:: JSON: class Added methods to the JSON class to parse the json
string and retrieve the names , values (simple or arrays) of a json pair
FEATURE:: JSON: class Added methods to the JSON class to deserialize GROUPS
and QUEUES
FEATURE:: Option setting to set the length of the Clarion code Editor line
before adding a &|Tools-Options-TextEditor-Clarion Specific Options NOTE: for
now this only apply to the hand coded Windows (Ctrl+D), not the App windows
FEATURE:: QuickXMLParser added Trace method that is called every time the
parser executes an interface method. (use OutPutDebugString)
FEATURE:: Send Email and Send SMS functions added to ClaRunExt
FEATURE:: Setting to enable to automatically kill the process (App's Exe)
before doing a build (only available on EE) Options-General-Project and
Solutions-"Kill Process before build"
FEATURE:: Show info about address in the call stack in form <module
name>:<offset> if module has no debug info or address can't be resolved

CHANGE: Extend sizes of variables used to hold a procedure's prototype and
parameter list
CHANGE: ABC Browse Class, method ReplaceSort is now virtual
```

CHANGE: ABC: Added support to the WindowExtenderClass to check if a processes other than the current one is running and be able to bring them to the front

CHANGE: ABC: Added support for Only one Instance of the procedure when the procedure is declared in a DLL

CHANGE: Added support to the GENERATEDClass module and SourceClass procedure template to generate generic members

CHANGE: Additional functions of the i64 family

CHANGE: Default vale for the DCT QuickView is Advanced before it was Simple

CHANGE: Default value to Require Dictionary is set to false

CHANGE: Fields of type reference-to-typed-GROUP are allowed now in structures

CHANGE: ICSharpCode.SharpDevelop.Gui.FormLocationHelper is deprecated, please use ICSharpCode.Core.FormPositionService.Instance instead.

CHANGE: IListControl new method GetSelectedItem

CHANGE: If the selection of the derived from column creates an error now the error is displayed in the error pad

CHANGE: Improve the Parser Thread start/stop process

CHANGE: Old default properties were not matching the name of the properties files used by the IDE.

CHANGE: Old files named SharpDevelop-teplates.xml was renamed to CodeSnippets.xml to easily identify it with the options it store

CHANGE: Set message text for constraint type run-time errors; 401: "Stack overflow", 402: "Null pointer de-reference", 404: "Arithmetic overflow", 405: "Value out of range", 406: "No return from function", 407: "No matching case label", 408: "Division by zero", 409: "Index out of range"

CHANGE: Solution Explorer (Clarion Project), when an item from the solution like a Icon, CLW, etc. is removed the previous item is now selected instead of going to the parent node

CHANGE: Support Windows 8.1 in the MANIFEST command for the linker

CHANGE: SystemString class: Format method is renamed to FormatString

CHANGE: The font for the TopSpeed ODBC driver dialogs has been changed to be consistent with the rest of the product

CHANGE: Update ClaTalk template to use the ClaRunExtClass

CHANGE: Updated the IPEXEC parameter parser to use equates for the states (faster than strings)

CHANGE: When Controls in the DCT are created (WINDOW/REPORT field representations) the Parser was re-reading the EQUATES.CLW and BUILTINS.CLW files from disk, now it caches those files after the first read. NOTE: If a user is modifying those files the changes will not be reflected until the IDE is re-started. NOTE2: If the user is using multiple EQUATES.CLW or BUILTINS.CLW files from multiple .Red files only the first one used will be processed for the DCT Control creation and Code Completion.

FIX: Procedure parameters could be imported wrong from a partial TXA (TXA having no [APPLICATION] section)

FIX: AppBrokerServiceManager was not showing the correct icon when the service was stopped

FIX: Clicking on the cancel button during DCT conversion or other Dct process was not stopping the process but just closing the window dialog

FIX: Code Completion was differentiating between upper case and lower case file name extension.

FIX: DCT: Sometimes when the Column contained invalid data, selecting a new columns could cause a null exception based on the invalid data

FIX: DCT: When any validation error happen on a derived column and the child is selected, the error was not displayed

FIX: DCT: when converting the DCT and an expected error happen, the error were only added to the Pad but not displayed in a Message()

FIX: Fix typo in the Icon viewer

FIX: GET(file,key) did not work with the SQLite driver if the key components where not the first fields in the record structure

FIX: Generator did not generate &REPORT fields correctly

FIX: Horizontal scrolling by touch in LIST controls did not work

FIX: If an invalid shortcut was found at startup the IDE would shut down

FIX: If there was an error in a redirection macro in an included redirection file, then the dialog displaying the error message indicated that the problem was in the top level redirection file rather than in the included redirection file.

FIX: Incorrect text was displayed in the Toolbar Build Solution and Rebuild Solution buttons

FIX: PNG images with an alpha channel would not 'stretch'

FIX: Position of scrollable WINDOW or IMAGE control could be calculated incorrectly on scrolling or on changing the PROP:XOrigin or PROP:YOrigin properties

FIX: Possible memory leaks if LIST control uses styles

FIX: REGION, PROMPT, RADIO controls were not using the correct Color Editor in the Window Designed for some color properties

FIX: REPORT Format Section Dialogs were not using the correct color dialog

FIX: REPORT parts were not using the correct Color Dialog for the color properties

FIX: Reference assignments of NULL to variables of type &GROUP or &GroupType produced unwanted statics

FIX: Separator was spelled incorrectly in the TopSpeed ODBC driver configuration dialog.

FIX: Setting PROP:HScroll and PROP:VScroll to TRUE for an IMAGE control caused displaying of scrollbar even if its real size is not enough to fill the control rectangle

FIX: Shortcut editor allowed for invalid shortcuts to be added to the IDE

FIX: Size of fields for Justification and Place Over in the DCT were too small

FIX: Some IDE dialogs were not re-displaying and positioned properly after were displayed in a secondary display that was unplugged

FIX: Sometimes the Close All Documents command will not close all the open Documents.

FIX: Sometimes the Code Completion will not work if a , is used in the last position of a line

FIX: The DCT Editor allow to create a field derived from other field that could create a recursive list of parents

FIX: The build system could use the wrong redirection file if there were multiple projects in a solution and those projects were in different folders and there was a clarion90.red file in each of those folders

FIX: The first time you did a generate in the IDE the creation of the exp file might not work properly

FIX: The redirection system was not parsing the %THISDIR% macro correctly when doing a build

FIX: TopSpeed driver would leak memory if you used the TableList SEND command

FIX: Topscan: Default text of the column header could be built incorrectly

FIX: Topscan: Incorrect column picture could break displaying of data

FIX: Topscan: Possible assert failure on the browsing file for the first time

FIX: Unexpected errors could occur on compile/link time if the name of a File View object clashes with the name of some user declared object

FIX: Upgrading of pre-C7 apps could lose the generated flag from project items

FIX: When a severe error happens during generation of the App sometimes the Build process would start but it could not be stopped, leaving the IDE in an state that needed shutdown

FIX: When accessing Btrieve files that had a PDECIMAL field in them that was a key component of a key with the OPT attribute, if you did a binary level compare (eg SavedRecord = Record), this would sometimes fail. DOCUMENTATION: Update the Btrieve docs to document the NULLPDECIMALS = ON|OFF driver string.

FIX: When there is a template that was missing the generation from the application pad could generate an exception and shutdown the IDE

FIX: When there is a template that was missing the generation of the App from the Application Pad could generate an exception and shutdown the IDE

FIX: You could create a local variable of type REPORT via the data pad. The data pad now restricts you to creating variables of type &REPORT

PTSS 34503: IPDVR - IPEXEC function parameters can not contain a `)'`.

PTSS 40060: EDITOR HANGS - with specific sequence of lines removed, (code folding could not identify the parent)

PTSS 40093: - JSON Class ToJSON() returns a badly formatted JSON string

PTSS 40205: Clarion Chain Report Previewer zoom was not working over the image

PTSS 40233: TopSpeed 5.0 driver Prompt Screen issues

PTSS 40267: Missing references after the import of the Clarion 6.3 app

PTSS 40342: AbSql.clw: renamed label TextFile to SV_SqlScriptFile to avoid clashing with common user labels

PTSS 40406: REPORT reference goes haywire

PTSS 40487: TXA import thrashes Parameters Entry

REGRESSION: Adding a file to a project that could not be found via

redirection added only the file name rather than the relative path to the file

Clarion 9.1 build 10655 release notes

```
*****
9.1 alpha 2 - 10655
*****

FEATURE: Added Dependent Assemblies (i.e. COM dlls) to the list of shipping
files
FEATURE: Templates: Added support for specifying dependent COM DLL in the
manifest (for Registration free COM)
FEATURE: Updated installers based on latest SetupBuilder release (4301)
FEATURE: Added some comments to the Dependency Assemblies dialog

FIX: Sometimes the first time the file driver list was accessed in the IDE
the list was empty
FIX: HIDE for controls/menu items in cloned toolbars/menus on child MDI
windows behaved as if DISABLE was called
FIX: IDE: If an omittable parameter in the parameter list is entered without
specifying its data type, the angle brackets could be dropped
FIX: Possible lockup on destroying a control from the frame toolbar if that
control was modified in a MDI child window
```

Clarion 9.1 build 10677 release notes

/--- Beta release (3) Clarion 9.1 --- Jan 30 ----- Fixes/Changes/Features--/

Note: The 9.1 release requires a rebuild of all Binaries (DLL and LIB)

9.1 alpha 3 - 10677

FIX: New scrolling/panning code was not firing all required events for mouse wheel/panning on a page-loaded Browse

FIX: Setting PROP:Selected to listbox could cause unwanted scrolling if new selected row is in view

FIX: The GENERATED flag could be lost in the project stored to the .APP

FIX: Builds did not work if you used the /ConfigDir switch and the version settings were changed from the default values

FIX: Build from a separate process did not work if the ConfigDir ended in a \

CHANGE: The MSBuild tasks CW, CWClear and Redirection now have an extra ConfigDir parameter which is set via the \$ConfigDir property. This parameter informs the task where to find the ClarionProperties.xml file to get settings

CHANGE: Template options global: Added ProcessorArchitecture and Language to the OCX manifest dependency settings

ALPHA FIX: The 9.1 ALPHA release TPS driver CREATED TPS files which couldn't be opened by older Clarion versions

Clarion 9.1 build 10741 release notes

/--- Beta release (4) Clarion 9.1 --- Feb 14 ----- Fixes/Changes/Features--/

Note: The 9.1 release requires a one-time rebuild of all Binaries (DLL and LIB)

9.1 alpha 4 - 10741

NEW: Added the Structure Designer to the Source File Context Menu

CHANGE: At present TIME(0) is converted to 0 when converting to LONG. To change this behaviour so that TIME(0) is converted to midnight (1) you can now set SYSTEM{PROP:TimeConversionPreservesZero} = TRUE.

CHANGE: An invalid file structure error didn't show the expected errorcode 47 and error() text

CHANGE: Trap exception generated when the DCT is not a valid DCT version

CHANGE: Use theme/system defined font in MESSAGE if fixed-pitch flag is not set

CHANGE: When a node in a tree is deleted (like in the Solution Explorer) now the previous file is selected.

FIX 40499: GROUP of time data control not disabled on clearing the Auto-Format check box

FIX 40501: Text of column headers included prefix of field

FIX 40502: Incorrect parameter of BIND in the Mass Update dialog

FIX 40514,40515: Resizing of some dialogs in TopScan worked incorrectly

FIX 50525: Lockup if date/time pattern contained more than one element

FIX: Comments in PRJ file could be parsed incorrectly

FIX: DROPID() could return unexpected empty string

FIX: Duplicated Day Of Week String in ABUTIL.INC and ABUTILUI.INC

FIX: Exception in the CLW compiler if function is declared with like it is a member implementing an interface method while class has no the IMPLEMENTS attribute

FIX: First Day Of Week functionality was not working on every calendar class

FIX: If the solution refernced an invalid or non-existing project, the post generation action was failing without a message

FIX: The GENERATED flag could be set to external modules

PTSS 40552: Setting of PROP:Alrt and PROP:Key without an index (i.e. dest{PROP:Alrt} = key instead of correctly as dest{PROP:Alrt,n} = key) did not alert

PTSS 40565: Changing position of scrollable area by setting the PROP:HScrollPos or PROP:VScrollPos property

Clarion 9.1 build 10789 release notes

/--- Beta release (5) Clarion 9.1 --- Mar 10 ----- Fixes/Changes/Features--/

Note: The 9.1 release requires a one-time rebuild of all Binaries (DLL and

LIB)

9.1 alpha 5 - 10789

CHANGE: If a second initialization of the FM or RM is found the Assert now shows the table name (circular dct references in relations)

FEATURE: The ODBC interface to TPS files now works from Clarion programs regardless of which version of Clarion the Clarion program was built with.

FEATURE: (All SQL drivers): NULL(datefield) and NULL(timefield) now return TRUE if they are part of a DATE/TIME group and the corresponding column on the server is NULL

FEATURE: Added Import and Export commands options to the Resource Editor Addin (to and from .res files)

FEATURE: Added option in the minimized popup menu of the AppBrokerService Manager to Restart the service instead to having to stop/restart it.

FEATURE: Before compiling all the files were saved but the project, now the project is also saved before compiling

FEATURE: EQUATES.CLW: new standard EQUATES for special time values

FEATURE: IP Driver added support to a new predefined table option to be able to define multiple servers in the owner with out modifying the table original information.

FEATURE: New built-in signature for dragging texts from external programs: '~TEXT' NB: The program must either have no manifest or have manifest with the privilege level set to "asInvoker" to allow dragging from the Explorer in W8

FEATURE: Use new pragmas define(date0) and define(time0) to control DATE->LONG and TIME->LONG conversions

FEATURE: When closing the Solution if any Project was modified and not saved the user will get a Message asking to save

FIX: Caret ghosts could be visible after clicking to ENTRY-like control

FIX: Merging of project can happen simultaneously but not for the same project

FIX: Removing a library from the project didn't mark the project as modified

FIX: Some files types when deleted from the project were not selecting its previous node in the project tree.

FIX: Some files were able to be added twice to the project. (Files with no extension and dots in its name)

FIX: The TS ODBC interface now works with System.Data.Odbc with ULONG, USHORT and BYTE fields and with ADO with BYTE fields.

FIX: The output project name could not have a '.' in its name - caused the CW Task to fail

FIX: The record picture of a field was not imported into the dct when importing from a Clarion 2.1 data file

FEATURE: OLE-based implementation of dragging from the Windows File Explorer.

NB: The program must either have no manifest or have manifest with the privilege level set to "asInvoker" to allow dragging from the Explorer in Win8

PTSS 40574: WORKAROUND: The Windows GDI layer can cause an exception on simultaneous calls to SelectObject for metafile DCs from several simultaneous

threads

PTSS 40592: Cursor muddy in Entry Fields

Clarion 9.1 build 10864 release notes

/--- Beta release (6) Clarion 9.1 --- Mar 27 ----- Fixes/Changes/Features--/

Note: The 9.1 release requires a one-time rebuild of all Binaries (DLL and LIB)

9.1 alpha 6 - 10864

FEATURE: New WindowManager method ModalEvent added that can be used to test if the current event is modal or not

FEATURE: The ODBC driver now supports generating JOIN structures where the the column names in the ON clause of the outer join are in the same order as their respective table names in the OUTER JOIN clause

FEATURE: The ODBC interface to TPS now supports LEFT OUTER JOIN clauses on the left hand as well as the right hand side of a join. If a join is on the left hand side, then it must be enclosed in brackets

FEATURE: QuickXMLParser: Added property to the QuickXMLParser to read the name of the nodes caseless

FEATURE: QuickXMLParser: Added method to the QuickXMLParser to know the last node name and keep an Stack of names.

FEATURE: XMLWriter class to write XML files

CHANGE: The debugger no longer displays procedures from the WXEh module

CHANGE: Added "Insert Code Snippet" to the Editor context popup menu (touch friendly)

CHANGE: Added "Select All" to the Editor context popup menu (touch friendly)

CHANGE: CWtouch.inc: changed the name of the Group from POINT to TPOINT to avoid benign warning

CHANGE: Initialize the SYSTEM font with data of the Windows current theme's font for message boxes

CHANGE: Change the sort order of the default value of the Standard Headers for editing

CHANGE: Change default value to Code Snippets edit to .CLW

CHANGE: Separated the XML write functionality from the XML Page write functionality

CHANGE: The Application Pad's build button changes its text based on the action selected (Generate/Build/Generate and Build), also the menu items that are not related to the chosen option are disabled now

CHANGE: When creating a wizarded App and changing the Target to create a DLL the template will clear out the default "Main" procedure

FIX: Fields within groups within an alias did not paste correctly when copied from the data pad or any of the dictionary dialogs inside the

application generator

FIX: The SQLite driver would sometimes put random chars at the end of a STRING field if the data stored in the database was less than the size of the STRING field

FIX: The SQLite driver would GPF if you issued 2 OPEN statements and then RECORDS(file)

FIX: The SQLite driver would sometimes throw an exception when retrieving large string fields

FIX: A trailing 0-character appended to result of DROPID() for drag-n-drop operation with the '~FILE' signature

FIX: Avoid ABC programs locking up when an error occurs when entering a browse

FIX: Changes made in the Advanced Quick View of the dictionary were not saved when you closed the dictionary

FIX: EVENT:DroppingDown might not be posted

FIX: Images on drop-down buttons were not drawn centered

FIX: PROP:Disconnect did not drop the connection if there were files still open. *Note that PROP:Disconnect cannot drop the connection if there are files opened on other threads.

FIX: PROP:Disconnect was removing all active statements from the connection, but not dropping the connection

FIX: Possible exception if one local class is declared as derived from another local class NOTE: If both parent and derived classes are local, they must be declared in the same scope. The compiler emits an error message if scopes are different.

FIX: Possible exception on accessing procedure's local data from methods of local classes if classes instantiated not in the procedure scope NOTE: If both parent and derived classes are local, they must be declared in the same scope. The compiler emits an error message if scopes are different.

FIX: Possible flicker in a parent window during opening a child window

FIX: Possible infinite recursion if LIST control has no USE attribute

FIX: Potential lockup during dragging

FIX: Scrolling with the mouse wheel worked incorrectly in LIST controls without the IMM attribute

FIX: Setting SYSTEM{PROP:Font*} properties not changed the font using in message boxes

FIX: The App could drop the application icon and pragmas manually entered when generating

FIX: Value of the SPIN control was not updated repeatedly while up or down button was pressed

FIX: When you removed a file from a project it would sometimes reappear in the project after generation even when the file was not generated

FIX: file{PROP:Profile} = '' did not stop logging of SQL statements

PTSS 40590: Make Clarion the default in Edit Standard Headers

PTSS 40591: Make .clw the default in Code Snippets

PTSS 40599: Stop WXEH.CPP from prompting

PTSS 40602: Regression: System Font No Longer works on MESSAGE boxes

PTSS 40603: SQLite app UEs and gets Record changed issues
PTSS 40611: DropID() is appending a NULL character if ~FILE
PTSS 40612: D&D deadlocks 9.1 RTL
PTSS 40618: Group fields in alias file gives compile error
PTSS 40642: PROP:RangeLow = 0, PROP:RangeHigh = 9999.99, PROP:Step = .01
dosen't allow the control to spin when the value is 0.00
PTSS 40644: Drop COMBO/LIST - EVENT:DroppingDown not generated and
incorrectly positioned icon
PTSS 40645: LIST mouse-wheel scrolling issues
VISUAL: Border of a themed control might not be redrawn from the hot state
after mouse cursor moved off it

Clarion 9.1 build 10916 release notes

/--- Beta release (7) Clarion 9.1 --- April 14 -----
Fixes/Changes/Features--/

Note: The 9.1 release requires a one-time rebuild of all Binaries (DLL and LIB)

9.1 alpha 7 - 10916

FEATURE: You can now set how many times AppGen tries to gain access to a file in the Application Options window

FEATURE: Added Method to the PopupClass - "EmptyItems" to empty the popup items when needed

CHANGE: Zero value in a TIME filed TIME(0) when converted to a Standard Time is now controlled via the SYSTEM property PROP:TimeZeroIsLongOne. The default behaviour is to convert TIME(0) to LONG(0). This is the same behaviour as previous versions of Clarion

CHANGE: If the SQLite dll is missing and tracing is enabled, this error is now written to the log

CHANGE: If you try to synchronise with an SQLite database and the IDE cannot find the SQLite dll, then a more informative error message is now presented.

CHANGE: When you had an invalid macro in a redirection file the dialog that was displayed did not display all the error text unless you resized it

CHANGE: When you have an invalid macro in a redirection file you are now only told about it once, not three or more times.

CHANGE: Added messages to the ASSERTs in the class to inform about the problems with a message

CHANGE: Clarion chain: Add new zoom ratio: Page Height

CHANGE: Use MS Shell Dlg font as default in OS dialogs

CHANGE: WindowResizeClass: Added assert when trying to resize a Tab control, the control that should be resized is the Sheet, not the Tab

CHANGE: AppGen now works better in environments where automatic backups are running

FIX: Help messages did not appear when in the Application Options window

FIX: The ODBC interface to TPS did not parse scalar functions that where escaped. Eg {fn max(column)} would cause an error, but max(column) was fine

FIX: The ODBC interface to TPS did not parse the long hand escape sequence for joins --(*VENDOR(MICROSOFT),PRODUCT(ODBC) OJ oj *)-- incorrectly

FIX: Background color might not be set for STRING controls without TRN attribute in REPORTs

FIX: Clarion chain: If width of zoomed image was less than width of Preview

WINDOW's client area, it displayed with incorrect ratio

FIX: Clarion chain: Preview WINDOW's dimensions were used to calculate image sizes instead of dimensions of its client area

FIX: IMAGE controls with scrollbars could be drawn incorrectly

FIX: If you removed a file from a project and the application was not open, then the next time you generated the file would reappear in the project

FIX: If you removed a file from a project and you then did not make any changes to the application, then the next time you generated the file would reappear in the project

FIX: Memory DCs must be initialized with background and text colors of the base DC

FIX: OpenFileDialog to pick a new icon was not opening in the last directory open when the option was set in the IDE Option

FIX: Report Writer could not convert TXR files which contained views, but the data files were not available.

FIX: SELECT for an ENTRY control with focus can cause appearance of a ghost caret

FIX: The Application Pad Sort button was not changing the icon after the full solution build.

FIX: The EVENT:MouseDown event is posted on processing the WM_LBUTTONDOWNCLK message for REGION controls as in previous CW versions

FIX: The core dlls were not copied to the destination folder if the application pad was used to build in batch mode

PTSS 37529: add a function to popup class to return TEXT of a menu item

PTSS 37601: In PopUpClass.Ask please support the 3rd parameter that the POPUP command does

REGRESSION: Click repeat time was used instead of click delay time after pressing SPIN buttons.

Clarion 9.1 build 10938 release notes

```
/--- Beta release (7) Clarion 9.1 --- April 28 -----  
Fixes/Changes/Features--/
```

Note: The 9.1 release requires a one-time rebuild of all Binaries (DLL and LIB)

```
*****  
9.1 alpha 8 - 10938  
*****
```

CHANGE: %ProcedureDateChanged and %ProcedureTimeChanged symbols changed value during generation for procedures with embed points containing the text

CHANGE: Report error if #EMBED statement has inconsistent attributes

FEATURE: Added support for automatic display of the On Screen Keyboard upon gain focus to ENTRY, TEXT and RTF controls for Win8. To enable the On Screen Keyboard the EnhancedFocus need to be enable.

FEATURE: Added support for the On Screen Keyboard in the EnhancedFocusClass. To enable the On Screen Keyboard the EnhancedFocus need to be enable.

FEATURE: Declaration of i64* family of RTL functions

FEATURE: Some changes to the Start Page, added more color configuration for the Start Page in Appearance.

FIX: DCT Editor Derived Fields List in the Column editor was not showing properly

FIX: DCT Editor Derived Fields List in the Column editor was not showing properly

FIX: Incorrect error messages when batch building could inject repeated failures

FIX: Release of a pressed VCR buttons on a LIST could be missed

FIX: Setting of PROP:YOrigin for LIST controls allowed negative and invalid large values

FIX: The SQL drivers would throw an exception if the connection to the server was lost and you had at least two threads opened and one of these threads, other than the first one was processing a VIEW structure (Eg. in a browse)

PTSS 40686: %ProcedureDateChanged giving wrong date

PTSS 40692: Weird VCR effects on list box scrolling

Clarion 9.1 build 10971 release notes

```
/--- Beta release (9) Clarion 9.1 --- May 05 ----- Fixes/Changes/Features--/
```

Note: The 9.1 release requires a one-time rebuild of all Binaries (DLL and LIB)

9.1 alpha 9 - 10971

CHANGE: Increase allowed max nesting level of {} groups in regular expressions

CHANGE: Show the file extension for uncategorized files in the Start Page

CHANGE: Use either CSTRING or STRING parameters with the email/sms and image editing APIs in ClaRunExt

CHANGE: Better output in the File Layout window

FEATURE: Added methods to ABBrowse to enable or disable the showing of the wait cursor in a Browse SetUseWaitCursor(True/False)

FEATURE: Added hover color to the Start page rows, and a GreenBar effect color (AltBody)

FEATURE: Error messages are now displayed, if wanted, if there are problems loading Clarunext.dll

FEATURE: New classes added to Clarunext to make it easy to send emails without using template to gen the code

FIX: If a new connection was needed by the SQL drivers and an old connection was available and a transaction was active, the reused connection was not added to the transaction frame

FIX: The ODBC based drivers would sometimes reuse an old connection when an existing active connection could be used

FIX: Window/Report designer could fail if the USE for the controls was ?0

FIX: ABC Wizard: When customization for the templates windows was set to default instead of CENTER it could generate an invalid window structure with a 1

FIX: Error in managing the nesting level of {} groups in regular expressions

FIX: Getting of PROPLIST:SortColumn could cause an error if PROPLIST:HasSortColumn returned FALSE

FIX: MATCH and STRPOS could return incorrect result if matching is case-insensitive

FIX: Possible exception on opening a multi-table file in TopScan

FIX: The error pad would sometimes show the wrong path to a file if that path was not in the same directory as the project but could normally be found via redirection

FIX: When the Field selection dialog was called to select a field and the app did not have a DCT the local data was not displayed in the FileSchema dialog unless you selected Module or Global data and then selected local data

FIX: Fix to templates that mixed MAP/TREE with HIDE (was causing the template to fail to register)

PTSS 40659: ?ComboList{07C31} may cause Clarion RTL internal exception

PTSS 40680: STRPOS errors

PTSS 40688: Error pad shows wrong path to file with compilation errors when

```
local RED file
PTSS 40697: Local Data was not displayed in the Select Field dialog
PTSS 40702: Topscan GPFs when opening multi-table file
```

Clarion 9.1 build 11014 release notes (first general beta release)

Build 11014 is the first general release of the Clarion 9.1 beta. The two biggest new features in the 9.1 version are full support for touch devices and reg-free COM.

All 9.1 releases carry a warning about the need to rebuild binaries for 9.1. This is a one-time requirement - if you already have 9.1-built binaries you do not need to rebuild them with each 9.1 release.

For more information on this release see <http://clarionsharp.com/blog/clarion-9-1-pre-release/>

```
/--- Beta release (10) Clarion 9.1 --- May 16 ----- Fixes/Changes/Features---/
```

```
Note: The 9.1 release requires a one-time rebuild of all your Binaries (DLL
and LIB).
```

```
You need to download the 9.1 versions of any 3rd party addons that you use.
```

```
*****
```

```
9.1 beta 10 (pre-release) - 11014
```

```
*****
```

```
FIX: Scrollbars might not appear as required in a WINDOW/IMAGE after resizing
and/or adding/moving scrollable controls
```

```
FIX: If you changed just the direction of a key component, the change was not
written to disk when the dictionary was saved.
```

```
FIX: Setting PROP:VScrollPos or PROP:HScrollPos to 255 did not scroll the
contents to max position
```

```
FIX: The file open dialog initial directory system could choose the wrong
starting folder based on file type
```

```
FIX: Exception occurred on processing of the pan gesture in TEXT controls if
both scrollbars were not enabled
```

```
CHANGE: When you select a file from the Start Page, the initial directory for
the equivalent file open dialog is set to the location of that file
```

```
*****
```

```
9.1 beta 9 - 10971
```

```
*****
```

```
CHANGE: Increase allowed max nesting level of {} groups in regular
expressions
```

```
CHANGE: Show the file extension for uncategorized files in the Start Page
```

```
CHANGE: Use either CSTRING or STRING parameters with the email/sms and image
editing APIs in ClaRunExt
```

```
CHANGE: Better output in the File Layout window
```

```
FEATURE: Added methods to ABBrowse to enable or disable the showing of the
wait cursor in a Browse SetUseWaitCursor(True/False)
```

FEATURE: Added hover color to the Start page rows, and a GreenBar effect color (AltBody)

FEATURE: Error messages are now displayed, if wanted, if there are problems loading Clarunext.dll

FEATURE: New classes added to Clarunext to make it easy to send emails without using template to gen the code

FIX: If a new connection was needed by the SQL drivers and an old connection was available and a transaction was active, the reused connection was not added to the transaction frame

FIX: The ODBC based drivers would sometimes reuse an old connection when an existing active connection could be used

FIX: Window/Report designer could fail if the USE for the controls was ?0

FIX: ABC Wizard: When customization for the templates windows was set to default instead of CENTER it could generate an invalid window structure with a 1

FIX: Error in managing the nesting level of {} groups in regular expressions

FIX: Getting of PROPLIST:SortColumn could cause an error if PROPLIST:HasSortColumn returned FALSE

FIX: MATCH and STRPOS could return incorrect result if matching is case-insensitive

FIX: Possible exception on opening a multi-table file in TopScan

FIX: The error pad would sometimes show the wrong path to a file if that path was not in the same directory as the project but could normally be found via redirection

FIX: When the Field selection dialog was called to select a field and the app did not have a DCT the local data was not displayed in the FileSchema dialog unless you selected Module or Global data and then selected local data

FIX: Fix to templates that mixed MAP/TREE with HIDE (was causing the template to fail to register)

PTSS 40659: ?ComboList{07C31} may cause Clarion RTL internal exception

PTSS 40680: STRPOS errors

PTSS 40688: Error pad shows wrong path to file with compilation errors when local RED file

PTSS 40697: Local Data was not displayed in the Select Field dialog

PTSS 40702: Topscan GPFs when opening multi-table file

9.1 beta 8 - 10938

CHANGE: %ProcedureDateChanged and %ProcedureTimeChanged symbols changed value during generation for procedures with embed points containing the text

CHANGE: Report error if #EMBED statement has inconsistent attributes

FEATURE: Added support for automatic display of the On Screen Keyboard upon gain focus to ENTRY, TEXT and RTF controls for Win8. To enable the On Screen Keyboard the EnhancedFocus need to be enable.

FEATURE: Added support for the On Screen Keyboard in the EnhancedFocusClass. To enable the On Screen Keyboard the EnhancedFocus need to be enable.

FEATURE: Declaration of i64* family of RTL functions

FEATURE: Some changes to the Start Page, added more color configuration for the Start Page in Appearance.

FIX: DCT Editor Derived Fields List in the Column editor was not showing properly

FIX: DCT Editor Derived Fields List in the Column editor was not showing properly

FIX: Incorrect error messages when batch building could inject repeated failures

FIX: Release of a pressed VCR buttons on a LIST could be missed

FIX: Setting of PROP:YOrigin for LIST controls allowed negative and invalid large values

FIX: The SQL drivers would throw an exception if the connection to the server was lost and you had at least two threads opened and one of these threads, other than the first one was processing a VIEW structure (Eg. in a browse)

PTSS 40686: %ProcedureDateChanged giving wrong date

PTSS 40692: Weird VCR effects on list box scrolling

9.1 beta 7 - 10916

FEATURE: You can now set how many times AppGen tries to gain access to a file in the Application Options window

FEATURE: Added Method to the PopUpClass - "EmptyItems" to empty the popup items when needed

CHANGE: Zero value in a TIME filed TIME(0) when converted to a Standard Time is now controlled via the SYSTEM property PROP:TimeZeroIsLongOne. The default behaviour is to convert TIME(0) to LONG(0). This is the same behaviour as previous versions of Clarion

CHANGE: If the SQLite dll is missing and tracing is enabled, this error is now written to the log

CHANGE: If you try to synchronise with an SQLite database and the IDE cannot find the SQLite dll, then a more informative error message is now presented.

CHANGE: When you had an invalid macro in a redirection file the dialog that was displayed did not display all the error text unless you resized it

CHANGE: When you have an invalid macro in a redirection file you are now only told about it once, not three or more times.

CHANGE: Added messages to the ASSERTs in the class to inform about the problems with a message

CHANGE: Clarion chain: Add new zoom ratio: Page Height

CHANGE: Use MS Shell Dlg font as default in OS dialogs

CHANGE: WindowResizeClass: Added assert when trying to resize a Tab control, the control that should be resized is the Sheet, not the Tab

CHANGE: AppGen now works better in environments where automatic backups are running

FIX: Help messages did not appear when in the Application Options window

FIX: The ODBC interface to TPS did not parse scalar functions that where escaped. Eg {fn max(column)} would cause an error, but max(column) was fine
FIX: The ODBC interface to TPS did not parse the long hand escape sequence for joins --(*VENDOR(MICROSOFT),PRODUCT(ODBC) OJ oj *)-- incorrectly
FIX: Background color might not be set for STRING controls without TRN attribute in REPORTs
FIX: Clarion chain: If width of zoomed image was less than width of Preview WINDOW's client area, it displayed with incorrect ratio
FIX: Clarion chain: Preview WINDOW's dimensions were used to calculate image sizes instead of dimensions of its client area
FIX: IMAGE controls with scrollbars could be drawn incorrectly
FIX: If you removed a file from a project and the application was not open, then the next time you generated the file would reappear in the project
FIX: If you removed a file from a project and you then did not make any changes to the application, then the next time you generated the file would reappear in the project
FIX: Memory DCs must be initialized with background and text colors of the base DC
FIX: OpenFileDialog to pick a new icon was not opening in the last directory open when the option was set in the IDE Option
FIX: Report Writer could not convert TXR files which contained views, but the data files were not available.
FIX: SELECT for an ENTRY control with focus can cause appearance of a ghost caret
FIX: The Application Pad Sort button was not changing the icon after the full solution build.
FIX: The EVENT:MouseDown event is posted on processing the WM_LBUTTONDOWNBLCLK message for REGION controls as in previous CW versions
FIX: The core dlls were not copied to the destination folder if the application pad was used to build in batch mode

PTSS 37529: add a function to popup class to return TEXT of a menu item
PTSS 37601: In PopUpClass.Ask please support the 3rd parameter that the POPUP command does
REGRESSION: Click repeat time was used instead of click delay time after pressing SPIN buttons.

9.1 beta 6 - 10864

FEATURE: New WindowManager method Modalevent added that can be used to test if the current event is modal or not
FEATURE: The ODBC driver now supports generating JOIN structures where the the column names in the ON clause of the outer join are in the same order as their respective table names in the OUTER JOIN clause
FEATURE: The ODBC interface to TPS now supports LEFT OUTER JOIN clauses on the left hand as well as the right hand side of a join. If a join is on the

left hand side, then it must be enclosed in brackets

FEATURE: QuickXMLParser: Added property to the QuickXMLParser to read the name of the nodes caseless

FEATURE: QuickXMLParser: Added method to the QuickXMLParser to know the last node name and keep an Stack of names.

FEATURE: XMLWriter class to write XML files

CHANGE: The debugger no longer displays procedures from the WXEh module

CHANGE: Added "Insert Code Snippet" to the Editor context popup menu (touch friendly)

CHANGE: Added "Select All" to the Editor context popup menu (touch friendly)

CHANGE: CWtouch.inc: changed the name of the Group from POINT to TPOINT to avoid benign warning

CHANGE: Initialize the SYSTEM font with data of the Windows current theme's font for message boxes

CHANGE: Change the sort order of the default value of the Standard Headers for editing

CHANGE: Change default value to Code Snippets edit to .CLW

CHANGE: Separated the XML write functionality from the XML Page write functionality

CHANGE: The Application Pad's build button changes its text based on the action selected (Generate/Build/Generate and Build), also the menu items that are not related to the chosen option are disabled now

CHANGE: When creating a wizarded App and changing the Target to create a DLL the template will clear out the default "Main" procedure

FIX: Fields within groups within an alias did not paste correctly when copied from the data pad or any of the dictionary dialogs inside the application generator

FIX: The SQLite driver would sometimes put random chars at the end of a STRING field if the data stored in the database was less than the size of the STRING field

FIX: The SQLite driver would GPF if you issued 2 OPEN statements and then RECORDS(file)

FIX: The SQLite driver would sometimes throw an exception when retrieving large string fields

FIX: A trailing 0-character appended to result of DROPID() for drag-n-drop operation with the '~FILE' signature

FIX: Avoid ABC programs locking up when an error occurs when entering a browse

FIX: Changes made in the Advanced Quick View of the dictionary were not saved when you closed the dictionary

FIX: EVENT: DroppingDown might not be posted

FIX: Images on drop-down buttons were not drawn centered

FIX: PROP:Disconnect did not drop the connection if there were files still open. *Note that PROP:Disconnect cannot drop the connection if there are files opened on other threads.

FIX: PROP:Disconnect was removing all active statements from the connection,

but not dropping the connection

FIX: Possible exception if one local class is declared as derived from another local class NOTE: If both parent and derived classes are local, they must be declared in the same scope. The compiler emits an error message if scopes are different.

FIX: Possible exception on accessing procedure's local data from methods of local classes if classes instantiated not in the procedure scope NOTE: If both parent and derived classes are local, they must be declared in the same scope. The compiler emits an error message if scopes are different.

FIX: Possible flicker in a parent window during opening a child window

FIX: Possible infinite recursion if LIST control has no USE attribute

FIX: Potential lockup during dragging

FIX: Scrolling with the mouse wheel worked incorrectly in LIST controls without the IMM attribute

FIX: Setting SYSTEM{PROP:Font*} properties not changed the font using in message boxes

FIX: The App could drop the application icon and pragmas manually entered when generating

FIX: Value of the SPIN control was not updated repeatedly while up or down button was pressed

FIX: When you removed a file from a project it would sometimes reappear in the project after generation even when the file was not generated

FIX: file{PROP:Profile} = '' did not stop logging of SQL statements

PTSS 40590: Make Clarion the default in Edit Standard Headers

PTSS 40591: Make .clw the default in Code Snippets

PTSS 40599: Stop WXEH.CPP from prompting

PTSS 40602: Regression: System Font No Longer works on MESSAGE boxes

PTSS 40603: SQLite app UEs and gets Record changed issues

PTSS 40611: DropID() is appending a NULL character if ~FILE

PTSS 40612: D&D deadlocks 9.1 RTL

PTSS 40618: Group fields in alias file gives compile error

PTSS 40642: PROP:RangeLow = 0, PROP:RangeHigh = 9999.99, PROP:Step = .01 doesn't allow the control to spin when the value is 0.00

PTSS 40644: Drop COMBO/LIST -EVENT: DroppingDown not generated and incorrectly positioned icon

PTSS 40645: LIST mouse-wheel scrolling issues

VISUAL: Border of a themed control might not be redrawn from the hot state after mouse cursor moved off it

9.1 beta 5 - 10789

CHANGE: If a second initialization of the FM or RM is found the Assert now shows the table name (circular dct references in relations)

FEATURE: The ODBC interface to TPS files now works from Clarion programs regardless of which version of Clarion the Clarion program was built with.

FEATURE: (All SQL drivers): NULL(datefield) and NULL(timefield) now return TRUE if they are part of a DATE/TIME group and the corresponding column on the server is NULL

FEATURE: Added Import and Export commands options to the Resource Editor Addin (to and from .res files)

FEATURE: Added option in the minimized popup menu of the AppBrokerService Manager to Restart the service instead to having to stop/restart it.

FEATURE: Before compiling all the files were saved but the project, now the project is also saved before compiling

FEATURE: EQUATES.CLW: new standard EQUATES for special time values

FEATURE: IP Driver added support to a new predefined table option to be able to define multiple servers in the owner with out modifying the table original information.

FEATURE: New built-in signature for dragging texts from external programs: '~TEXT' NB: The program must either have no manifest or have manifest with the privilege level set to "asInvoker" to allow dragging from the Explorer in W8

FEATURE: Use new pragmas define(date0) and define(time0) to control DATE->LONG and TIME->LONG conversions

FEATURE: When closing the Solution if any Project was modified and not saved the user will get a Message asking to save

FIX: Caret ghosts could be visible after clicking to ENTRY-like control

FIX: Merging of project can happen simultaneously but not for the same project

FIX: Removing a library from the project didn't mark the project as modified

FIX: Some files types when deleted from the project were not selecting its previous node in the project tree.

FIX: Some files were able to be added twice to the project. (Files with no extension and dots in its name)

FIX: The TS ODBC interface now works with System.Data.Odbc with ULONG, USHORT and BYTE fields and with ADO with BYTE fields.

FIX: The output project name could not have a '.' in its name - caused the CW Task to fail

FIX: The record picture of a field was not imported into the dct when importing from a Clarion 2.1 data file

FEATURE: OLE-based implementation of dragging from the Windows File Explorer. NB: The program must either have no manifest or have manifest with the privilege level set to "asInvoker" to allow dragging from the Explorer in Win8

PTSS 40574: WORKAROUND: The Windows GDI layer can cause an exception on simultaneous calls to SelectObject for metafile DCs from several simultaneous threads

PTSS 40592: Cursor muddy in Entry Fields

9.1 beta 5 - 10789

CHANGE: If a second initialization of the FM or RM is found the Assert now

shows the table name (circular dct references in relations)

FEATURE: The ODBC interface to TPS files now works from Clarion programs regardless of which version of Clarion the Clarion program was built with.

FEATURE: (All SQL drivers): NULL(datefield) and NULL(timefield) now return TRUE if they are part of a DATE/TIME group and the corresponding column on the server is NULL

FEATURE: Added Import and Export commands options to the Resource Editor Addin (to and from .res files)

FEATURE: Added option in the minimized popup menu of the AppBrokerService Manager to Restart the service instead to having to stop/restart it.

FEATURE: Before compiling all the files were saved but the project, now the project is also saved before compiling

FEATURE: EQUATES.CLW: new standard EQUATES for special time values

FEATURE: IP Driver added support to a new predefined table option to be able to define multiple servers in the owner with out modifying the table original information.

FEATURE: New built-in signature for dragging texts from external programs: '~TEXT' NB: The program must either have no manifest or have manifest with the privilege level set to "asInvoker" to allow dragging from the Explorer in W8

FEATURE: Use new pragmas define(date0) and define(time0) to control DATE->LONG and TIME->LONG conversions

FEATURE: When closing the Solution if any Project was modified and not saved the user will get a Message asking to save

FIX: Caret ghosts could be visible after clicking to ENTRY-like control

FIX: Merging of project can happen simultaneously but not for the same project

FIX: Removing a library from the project didn't mark the project as modified

FIX: Some files types when deleted from the project were not selecting its previous node in the project tree.

FIX: Some files were able to be added twice to the project. (Files with no extension and dots in its name)

FIX: The TS ODBC interface now works with System.Data.Odbc with ULONG, USHORT and BYTE fields and with ADO with BYTE fields.

FIX: The output project name could not have a '.' in its name - caused the CW Task to fail

FIX: The record picture of a field was not imported into the dct when importing from a Clarion 2.1 data file

FEATURE: OLE-based implementation of dragging from the Windows File Explorer. NB: The program must either have no manifest or have manifest with the privilege level set to "asInvoker" to allow dragging from the Explorer in Win8

PTSS 40574: WORKAROUND: The Windows GDI layer can cause an exception on simultaneous calls to SelectObject for metafile DCs from several simultaneous threads

PTSS 40592: Cursor muddy in Entry Fields

9.1 beta 4 - 10741

FEATURE: (All SQL drivers): NULL(datefield) and NULL(timefield) now return TRUE if they are part of a DATE/TIME group and the corresponding column on the server is NULL
FEATURE: (All SQL drivers): NULL(datefield) and NULL(timefield) now return TRUE if they are part of a DATE/TIME group and the corresponding column on the server is NULL
FEATURE: (All SQL drivers): NULL(datefield) and NULL(timefield) now return TRUE if they are part of a DATE/TIME group and the corresponding column on the server is NULL
NEW: Added the Structure Designer to the Source File Context Menu
CHANGE: At present TIME(0) is converted to 0 when converting to LONG. To change this behaviour so that TIME(0) is converted to midnight (1) you can now set SYSTEM{PROP:TimeConversionPreservesZero} = TRUE.
CHANGE: An invalid file structure error didn't show the expected errorcode 47 and error() text
CHANGE: Trap exception generated when the DCT is not a valid DCT version
CHANGE: Use theme/system defined font in MESSAGE if fixed-pitch flag is not set
CHANGE: When a node in a tree is deleted (like in the Solution Explorer) now the previous file is selected.
FIX 40499: GROUP of time data control not disabled on clearing the Auto-Format check box
FIX 40501: Text of column headers included prefix of field
FIX 40502: Incorrect parameter of BIND in the Mass Update dialog
FIX 40514,40515: Resizing of some dialogs in TopScan worked incorrectly
FIX 50525: Lockup if date/time pattern contained more than one element
FIX: Comments in PRJ file could be parsed incorrectly
FIX: DROPID() could return unexpected empty string
FIX: Duplicated Day Of Week String in ABUTIL.INC and ABUTILUI.INC
FIX: Exception in the CLW compiler if function is declared with like it is a member implementing an interface method while class has no the IMPLEMENTS attribute
FIX: First Day Of Week functionality was not working on every calendar class
FIX: If the solution referenced an invalid or non-existing project, the post generation action was failing without a message
FIX: The GENERATED flag could be set to external modules
PTSS 40552: Setting of PROP:Alrt and PROP:Key without an index (i.e. dest{PROP:Alrt} = key instead of correctly as dest{PROP:Alrt,n} = key) did not alert
PTSS 40565: Changing position of scrollable area by setting the PROP:HScrollPos or PROP:VScrollPos property

9.1 beta 3 - 10677

FIX: New scrolling/panning code was not firing all required events for mouse wheel/panning on a page-loaded Browse
FIX: Setting PROP:Selected to listbox could cause unwanted scrolling if new selected row is in view
FIX: The GENERATED flag could be lost in the project stored to the .APP
FIX: Builds did not work if you used the /ConfigDir switch and the version settings were changed from the default values
FIX: Build from a separate process did not work if the ConfigDir ended in a \
CHANGE: The MSBuild tasks CW, CWClear and Redirection now have an extra ConfigDir parameter which is set via the \$ConfigDir property. This parameter informs the task where to find the ClarionProperties.xml file to get settings
CHANGE: Template options global: Added ProcessorArchitecture and Language to the OCX manifest dependency settings
ALPHA FIX: The 9.1 ALPHA release TPS driver CREATED TPS files which couldn't be opened by older Clarion versions

9.1 beta 2 - 10655

FEATURE: Added Dependent Assemblies (i.e. COM dlls) to the list of shipping files
FEATURE: Templates: Added support for specifying dependent COM DLL in the manifest (for Registration free COM)
FEATURE: Updated installers based on latest SetupBuilder release (4301)
FEATURE: Added some comments to the Dependency Assemblies dialog
FIX: Sometimes the first time the file driver list was accessed in the IDE the list was empty
FIX: HIDE for controls/menu items in cloned toolbars/menus on child MDI windows behaved as if DISABLE was called
FIX: IDE: If an omittable parameter in the parameter list is entered without specifying its data type, the angle brackets could be dropped
FIX: Possible lockup on destroying a control from the frame toolbar if that control was modified in a MDI child window

9.1 beta 1 - 10638

FEATURE:: Support of Touch input
FEATURE:: Support registration-free activation of COM objects from side-by-side assemblies
FEATURE: Added support for routines in DCT triggers code. NOTE: Restrictions: the routines name should not start with the word "routine" (will make the code generate incorrectly). After the first routine is found the rest of the code of will be treated as routine code and output in column

1 after the RETURN of the method

FEATURE:: Added two new methods to the resize class to know when resizing starts and finishes: WindowResizeBegin and WindowResizeEnd

FEATURE:: Before building if the process CCC.EXE is found running the IDE will try to stop it, if is successful it will add a message in the Error List (Message) This was added to stop the error on building related to the Catalyst Control Center Utility (aka CCC.EXE)

FEATURE:: Files for custom handling of touch input in programs; CWTOUCH.CLW, CWTOUCH.INC, CWTOUCHDEF.INC

FEATURE:: JSON: Added an example that show how to serialize and deserialize a QUEUE to/from json

FEATURE:: JSON: Added methods to the JSON Class to parse the Json results

FEATURE:: JSON: Allow to use a PICTURE to format numbers in the ToJSON groups and queue and to DEFORMAT the numbers with @BOOL support

FEATURE:: JSON: class Added methods to the JSON class to parse the json string and retrieve the names , values (simple or arrays) of a json pair

FEATURE:: JSON: class Added methods to the JSON class to deserialize GROUPS and QUEUES

FEATURE:: Option setting to set the length of the Clarion code Editor line before adding a &|Tools-Options-TextEditor-Clarion Specific Options NOTE: for now this only apply to the hand coded Windows (Ctrl+D), not the App windows

FEATURE:: QuickXMLParser added Trace method that is called every time the parser executes an interface method. (use OutPutDebugString)

FEATURE:: Send Email and Send SMS functions added to ClaRunExt

FEATURE:: Setting to enable to automatically kill the process (App's Exe) before doing a build (only available on EE) Options-General-Project and Solutions-"Kill Process before build"

FEATURE:: Show info about address in the call stack in form <module name>:<offset> if module has no debug info or address can't be resolved

CHANGE: Extend sizes of variables used to hold a procedure's prototype and parameter list

CHANGE: ABC Browse Class, method ReplaceSort is now virtual

CHANGE: ABC: Added support to the WindowExtenderClass to check if a processes other than the current one is running and be able to bring them to the front

CHANGE: ABC: Added support for Only one Instance of the procedure when the procedure is declared in a DLL

CHANGE: Added support to the GENERATEDClass module and SourceClass procedure template to generate generic members

CHANGE: Additional functions of the i64 family

CHANGE: Default vale for the DCT QuickView is Advanced before it was Simple

CHANGE: Default value to Require Dictionary is set to false

CHANGE: Fields of type reference-to-typed-GROUP are allowed now in structures

CHANGE: ICSharpCode.SharpDevelop.Gui.FormLocationHelper is deprecated, please use ICSharpCode.Core.FormPositionService.Instance instead.

CHANGE: IListControl new method GetSelectedItem

CHANGE: If the selection of the derived from column creates an error now the error is displayed in the error pad

CHANGE: Improve the Parser Thread start/stop process

CHANGE: Old default properties were not matching the name of the properties files used by the IDE.

CHANGE: Old files named SharpDevelop-templates.xml was renamed to CodeSnippets.xml to easily identify it with the options it store

CHANGE: Set message text for constraint type run-time errors; 401: "Stack overflow", 402: "Null pointer de-reference", 404: "Arithmetic overflow", 405: "Value out of range", 406: "No return from function", 407: "No matching case label", 408: "Division by zero", 409: "Index out of range"

CHANGE: Solution Explorer (Clarion Project), when an item from the solution like a Icon, CLW, etc. is removed the previous item is now selected instead of going to the parent node

CHANGE: Support Windows 8.1 in the MANIFEST command for the linker

CHANGE: SystemString class: Format method is renamed to FormatString

CHANGE: The font for the TopSpeed ODBC driver dialogs has been changed to be consistent with the rest of the product

CHANGE: Update ClaTalk template to use the ClaRunExtClass

CHANGE: Updated the IPEXEC parameter parser to use equates for the states (faster than strings)

CHANGE: When Controls in the DCT are created (WINDOW/REPORT field representations) the Parser was re-reading the EQUATES.CLW and BUILTINS.CLW files from disk, now it caches those files after the first read. NOTE: If a user is modifying those files the changes will not be reflected until the IDE is re-started. NOTE2: If the user is using multiple EQUATES.CLW or BUILTINS.CLW files from multiple .Red files only the first one used will be processed for the DCT Control creation and Code Completion.

FIX: Procedure parameters could be imported wrong from a partial TXA (TXA having no [APPLICATION] section)

FIX: AppBrokerServiceManager was not showing the correct icon when the service was stopped

FIX: Clicking on the cancel button during DCT conversion or other Dct process was not stopping the process but just closing the window dialog

FIX: Code Completion was differentiating between upper case and lower case file name extension.

FIX: DCT: Sometimes when the Column contained invalid data, selecting a new columns could cause a null exception based on the invalid data

FIX: DCT: When any validation error happen on a derived column and the child is selected, the error was not displayed

FIX: DCT: when converting the DCT and an expected error happen, the error were only added to the Pad but not displayed in a Message()

FIX: Fix typo in the Icon viewer

FIX: GET(file,key) did not work with the SQLite driver if the key components where not the first fields in the record structure

FIX: Generator did not generate &REPORT fields correctly

FIX: Horizontal scrolling by touch in LIST controls did not work

FIX: If an invalid shortcut was found at startup the IDE would shut down

FIX: If there was an error in a redirection macro in an included redirection

file, then the dialog displaying the error message indicated that the problem was in the top level redirection file rather than in the included redirection file.

FIX: Incorrect text was displayed in the Toolbar Build Solution and Rebuild Solution buttons

FIX: PNG images with an alpha channel would not 'stretch'

FIX: Position of scrollable WINDOW or IMAGE control could be calculated incorrectly on scrolling or on changing the PROP:XOrigin or PROP:YOrigin properties

FIX: Possible memory leaks if LIST control uses styles

FIX: REGION, PROMPT, RADIO controls were not using the correct Color Editor in the Window Designed for some color properties

FIX: REPORT Format Section Dialogs were not using the correct color dialog

FIX: REPORT parts were not using the correct Color Dialog for the color properties

FIX: Reference assignments of NULL to variables of type &GROUP or &GroupType produced unwanted statics

FIX: Separator was spelled incorrectly in the TopSpeed ODBC driver configuration dialog.

FIX: Setting PROP:HScroll and PROP:VScroll to TRUE for an IMAGE control caused displaying of scrollbar even if its real size is not enough to fill the control rectangle

FIX: Shortcut editor allowed for invalid shortcuts to be added to the IDE

FIX: Size of fields for Justification and Place Over in the DCT were too small

FIX: Some IDE dialogs were not re-displaying and positioned properly after were displayed in a secondary display that was unplugged

FIX: Sometimes the Close All Documents command will not close all the open Documents.

FIX: Sometimes the Code Completion will not work if a , is used in the last position of a line

FIX: The DCT Editor allow to create a field derived from other field that could create a recursive list of parents

FIX: The build system could use the wrong redirection file if there were multiple projects in a solution and those projects were in different folders and there was a clarion90.red file in each of those folders

FIX: The first time you did a generate in the IDE the creation of the exp file might not work properly

FIX: The redirection system was not parsing the %THISDIR% macro correctly when doing a build

FIX: TopSpeed driver would leak memory if you used the TableList SEND command

FIX: Topscan: Default text of the column header could be built incorrectly

FIX: Topscan: Incorrect column picture could break displaying of data

FIX: Topscan: Possible assert failure on the browsing file for the first time

FIX: Unexpected errors could occur on compile/link time if the name of a File View object clashes with the name of some user declared object

FIX: Upgrading of pre-C7 apps could lose the generated flag from project items

FIX: When a severe error happens during generation of the App sometimes the Build process would start but it could not be stopped, leaving the IDE in an state that needed shutdown

FIX: When accessing Btrieve files that had a PDECIMAL field in them that was a key component of a key with the OPT attribute, if you did a binary level compare (eg SavedRecord = Record), this would sometimes fail. DOCUMENTATION: Update the Btrieve docs to document the NULLPDECIMALS = ON|OFF driver string.

FIX: When there is a template that was missing the generation from the application pad could generate an exception and shutdown the IDE

FIX: When there is a template that was missing the generation of the App from the Application Pad could generate an exception and shutdown the IDE

FIX: You could create a local variable of type REPORT via the data pad. The data pad now restricts you to creating variables of type &REPORT

PTSS 34503: IPDVR - IPEXEC function parameters can not contain a `)'`.

PTSS 40060: EDITOR HANGS - with specific sequence of lines removed, (code folding could not identify the parent)

PTSS 40093: - JSON Class ToJSON() returns a badly formatted JSON string

PTSS 40205: Clarion Chain Report Previewer zoom was not working over the image

PTSS 40233: TopSpeed 5.0 driver Prompt Screen issues

PTSS 40267: Missing references after the import of the Clarion 6.3 app

PTSS 40342: AbSql.clw: renamed label TextFile to SV_SqlScriptFile to avoid clashing with common user labels

PTSS 40406: REPORT reference goes haywire

PTSS 40487: TXA import thrashes Parameters Entry

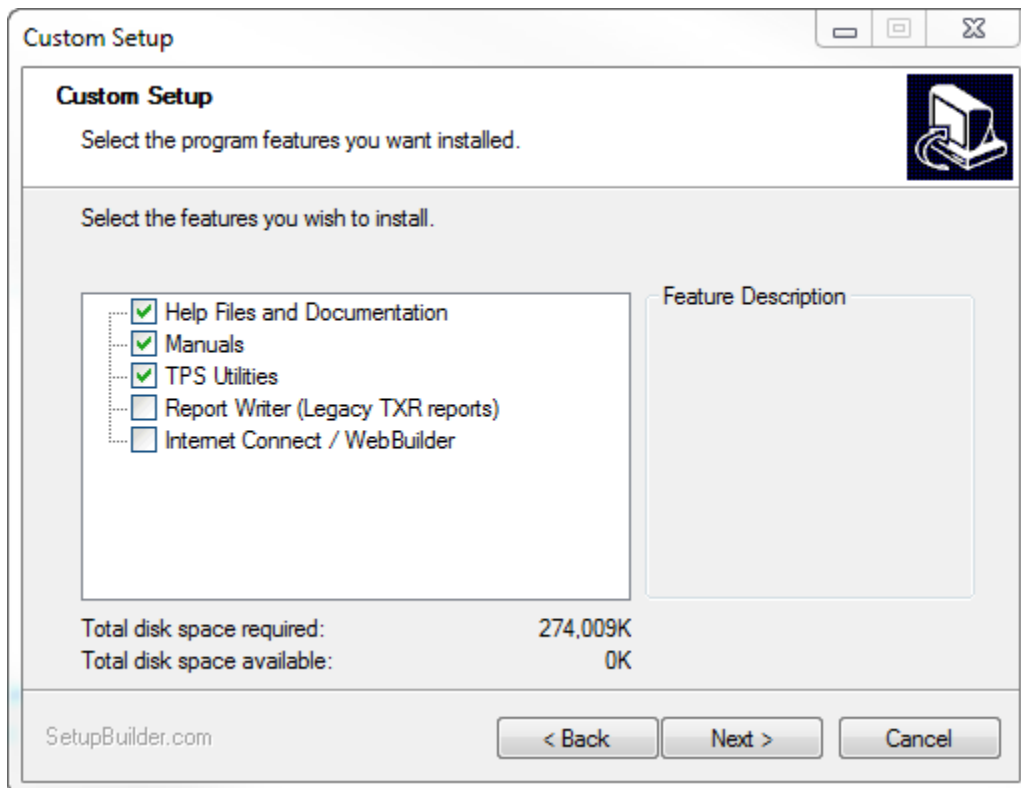

REGRESSION: Adding a file to a project that could not be found via

redirection added only the file name rather than the relative path to the file

Clarion 9.1 under the hood - Part 1

When I get a new Clarion release one of my favorite things to do is pull out Beyond Compare and see what changes have been made to the shipping product. That won't tell me much if anything about the compiled part of the product, but as Clarion ships with a lot of template and Clarion source those comparisons are often revealing.

But first a quick note about using Custom Setup on install. Besides choosing an install directory, you can select up to five optional features. In the Clarion 9.0 install all but the Report Writer were selected by default. When I ran the 9.1 install all options were unselected by default. I manually chose the options I wanted.

New (and moved) stuff

The first new file I spotted was data\options\CodeSnippets.xml, but it turns out this is SharpDevelop-templates.xml under a different (and more appropriate) name. The contents haven't changed significantly, but I think it's still worth remembering what's here. The original file no doubt had the VB and C++ snippets; SoftVelocity added Clarion (CLW) snippets:

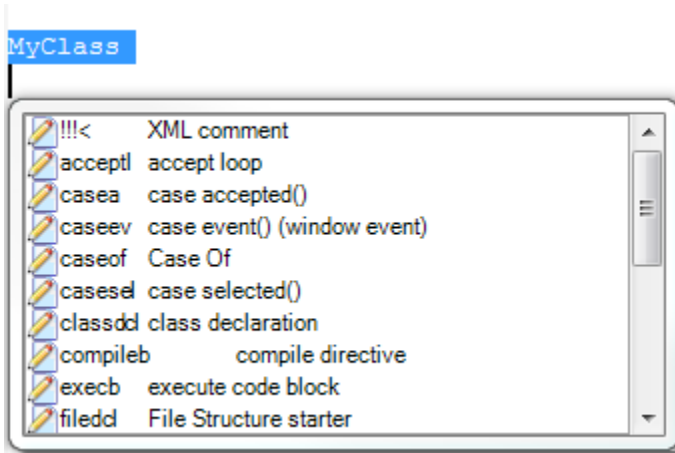

- acceptl - accept loop
- caseof - Case Of
- casea - case accepted()
- caseev - case event()
- casesel - case selected()
- execb - execute code block
- ifbreak - if Condition then break (inside a loop)
- ife - If Else
- loopi - Loop i = initial TO limit [BY step] LOOP i = | TO limit [BY step]
- loopu - loop until
- loopw - loop while
- classdcl - class declaration
- filedcl - File Structure starter

- loopqueue - loop through a given queue
- groupdcl - group structure starter
- queuedcl - queue structure starter
- routinedef - routine starter
- procdef - procedure starter

and ClarionSharp (CLN) snippets:

- ife - IF Else
- omdi - open an MDI child window ! create instance of a window and open as an MDI child
- tryc - Try Catch
- trycf - Try Catch Finally
- tryf - Try Finally
- loopw - Loop While
- loopu - Loop Until
- loopi - Loop i = initial TO limit [BY step] Loop i = | TO limit [BY step]
- caseof - Case Of
- execb - Execute code block

Some code snippets require you to select some text first. For instance, type MyClass then highlight the text and press Ctrl-J. Select the class declaration snippet:

Tada!

```

MyClass
CONSTRUCT
DESTRUCT

CLASS !, TYPE
    PROCEDURE
    PROCEDURE
    !Properties
    !Methods
END
  
```

You'll still need to declare and write any method implementations, of course.

If you don't select some text first you'll get a different result:

```

CLASS !, TYPE
CONSTRUCT
DESTRUCT

PROCEDURE
PROCEDURE
    !Properties
    !Methods
END
  
```

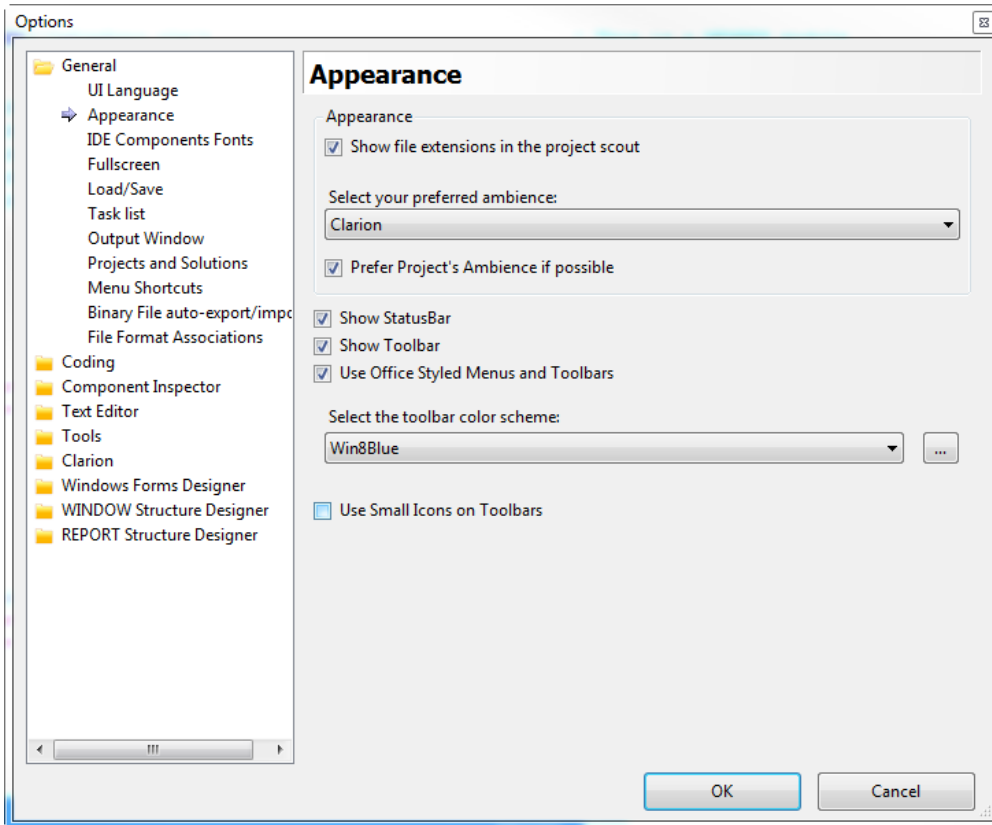

But that's easily remedied - just stick a label in front of CLASS and reformat with Ctrl-I.

The file structure code snippet is similarly pretty simple:

```
MyFile                               FILE, DRIVER( )
                                      RECORD
                                      END
                                      END
```

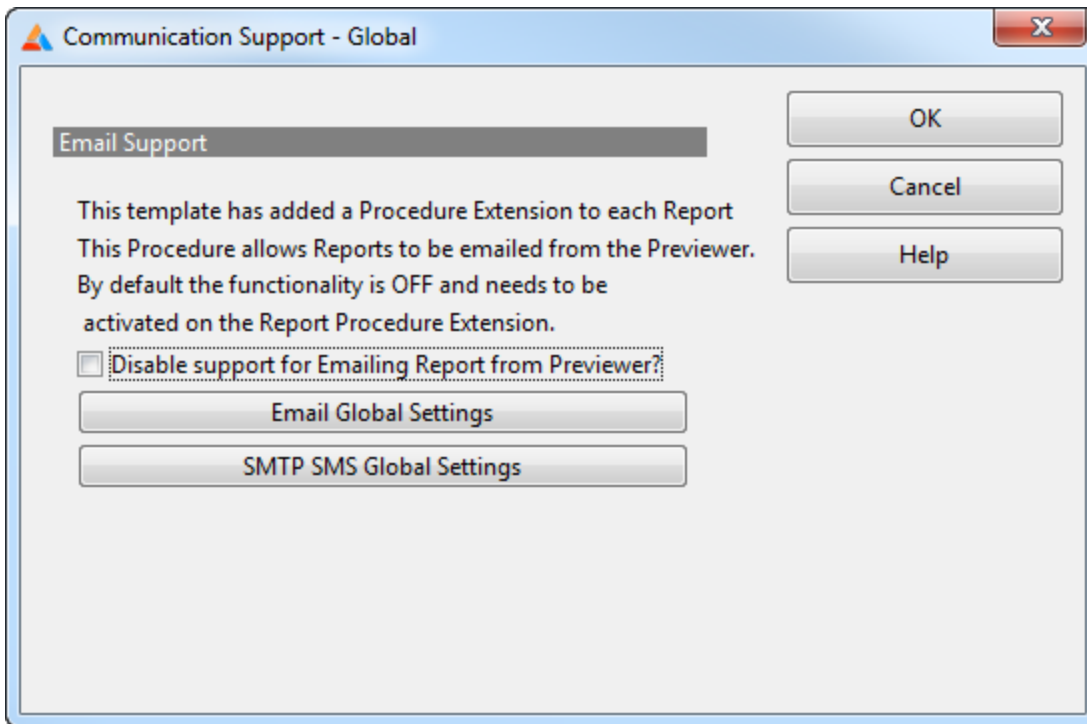

I'm not sure I'll ever bother with snippets for IF statements and the like, and for classes I rely heavily on the [ClarionLive Class Creator](#), But I'll keep an eye out for code I'm writing repeatedly that might fit the constraints of CodeSnippets.xml.

There is a new toolbar color scheme called Win8Blue. You can choose it via Options | General | Appearance.

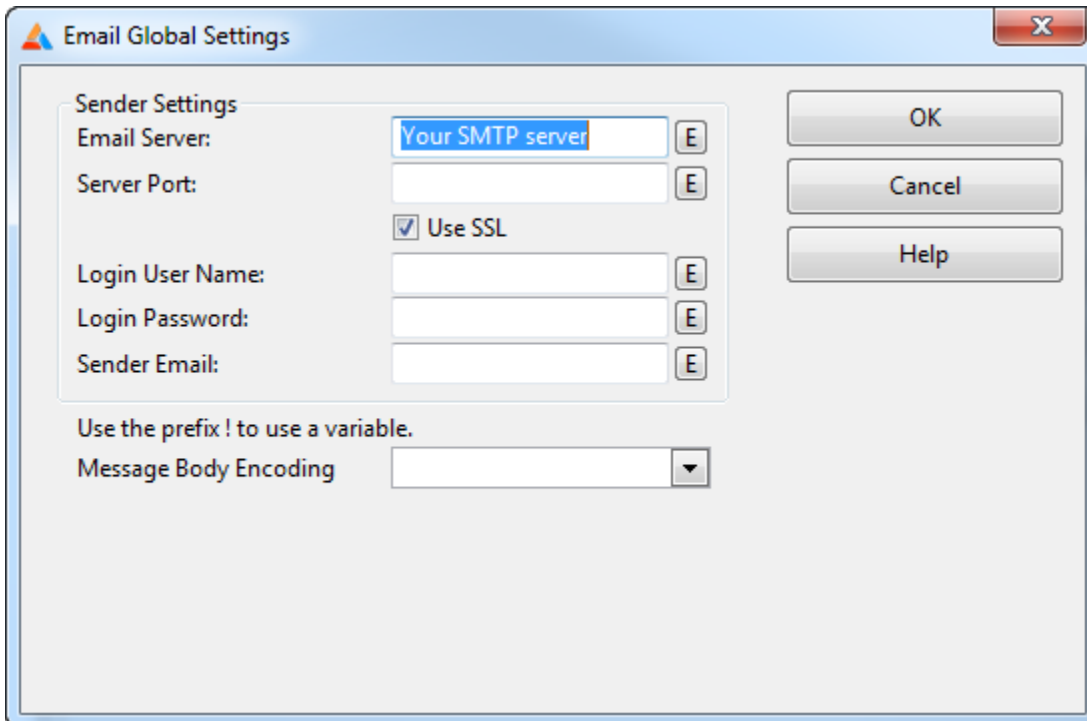

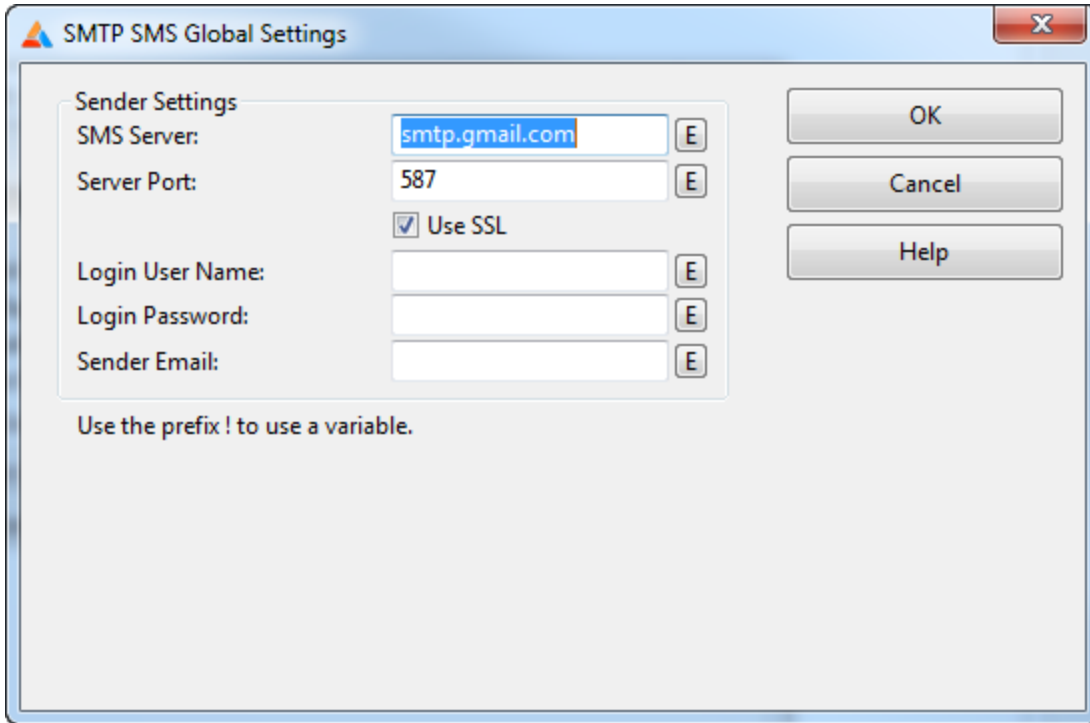

Email templates

There is a new template called SVCommunicationSupport. This template includes a global extension with options for sending email and text messages.

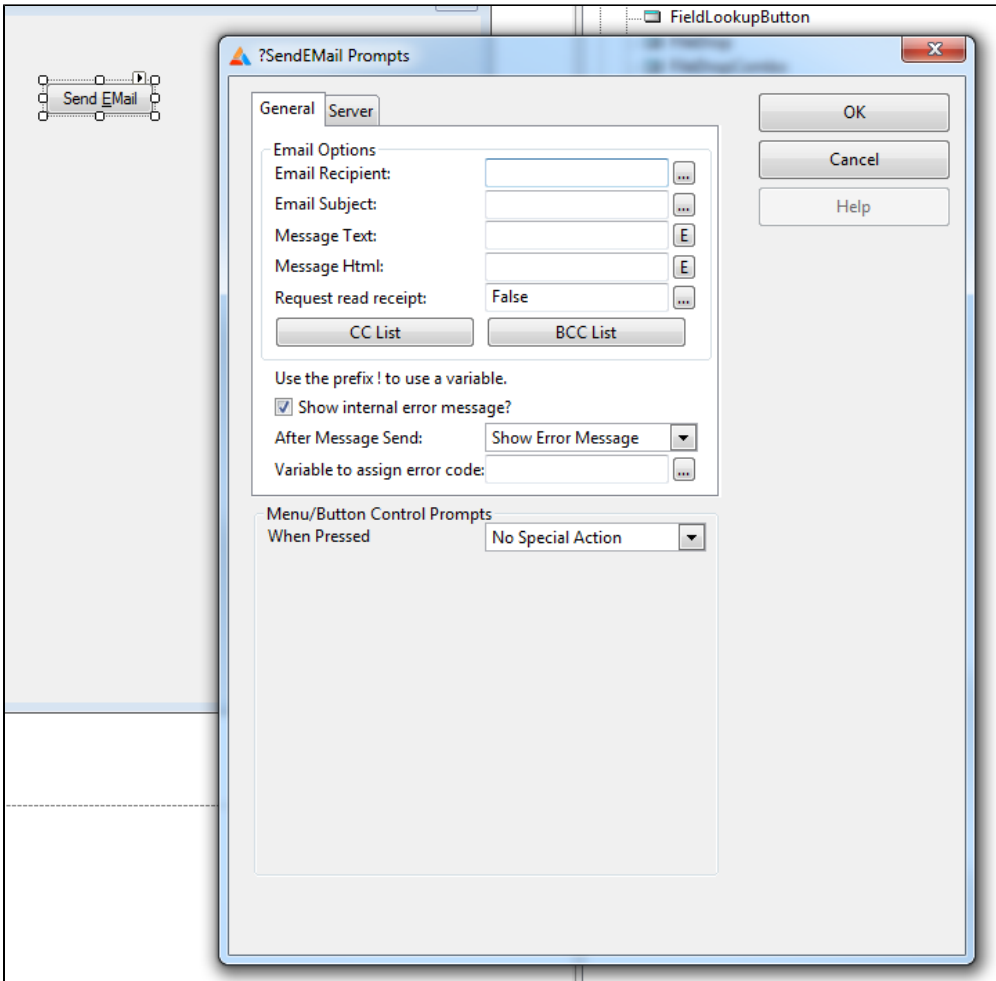

Both email and SMS are sent via SMTP. The two settings windows are almost identical:

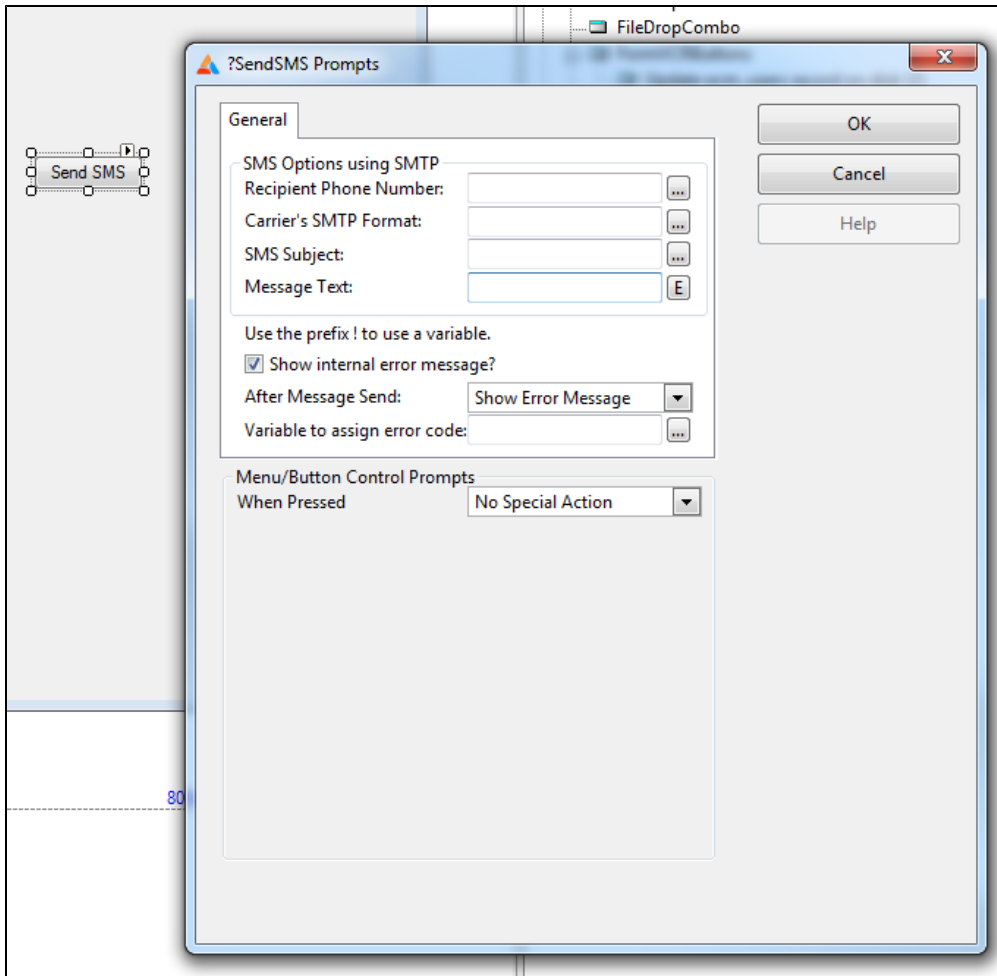

There are matching control templates. Drop a Send Email button on a window and select Actions to fill in the remaining settings:

Here are the SMS settings:

Email classes

There are a bunch of new source files, which I'll cover in alphabetical order.

The email files include:

- ClaMail.CLW
- ClaMail.INC

ClaMail.INC contains three class declarations:

- SMSMailClient CLASS,TYPE
- SMSClient CLASS(SMSMailClient),TYPE
- MailClient CLASS(SMSMailClient),TYPE

The release notes indicate that classes were added to make it possible to send email without needed to generate code via the templates, so presumably these are the classes in question.

Touch support

Touch support is declared in the following files:

- CWTOUCH.CLW
- CWTOUCH.INC
- CWTOUCHDEF.INC

CWTouch.inc includes the following classes:

- InputPoint
- TouchPoint
- InputData

- TouchData

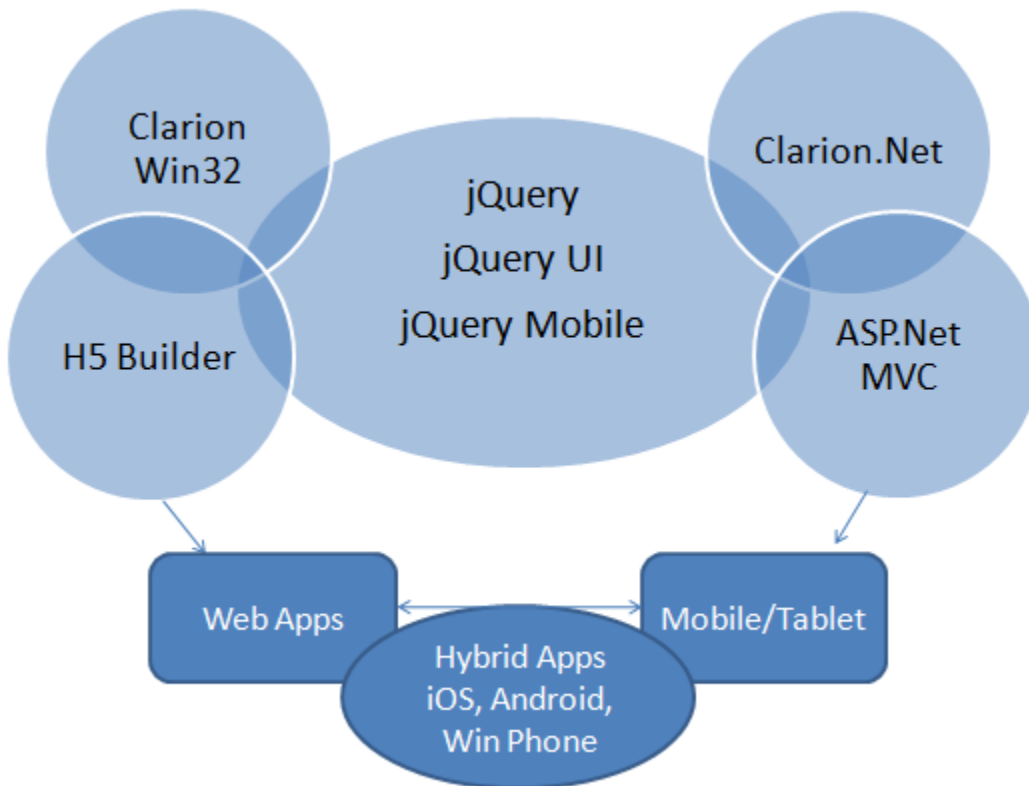

These classes are primarily data but each has a Next() method which, somewhat mysteriously, only returns NULL.

The following COM interfaces are also defined:

- IGestureResponder
- IPointerResponder
- ITouchNotifier

H5 Builder

The H5 product, which was demonstrated in a very early form at the 2013 DevCon, promises to blend "the best features of Internet Connect (IC) and Web Builder (WB), joined with the jQuery family and HTML5/CSS". The idea is to allow you to deliver Clarion apps as private web apps to business users (as opposed to large scale web sites).

The SoftVelocity blog has more information: <http://clarionsharp.com/blog/clarion-h5/>

Although H5 is not yet fully included with Clarion 9.1, a number of files are shipping. They include:

- H5BROKER.CLW
- H5BROKER.INC
- H5CLIENT.CLW
- H5CLIENT.INC
- H5CNTRLS.CLW
- H5CNTRLS.INC
- H5EVENT.CLW
- H5EVENT.INC
- H5FILES.CLW
- H5FILES.INC
- H5HTML.CLW
- H5HTML.INC
- H5HTTP.CLW
- H5HTTP.INC

- H5JSL.CLW
- H5JSL.INC

64 bit functions

Also new in Clarion 9.1 is a new set of RTL functions for dealing with 64 bit signed and unsigned integers. The functions are declared in i64.INC and provide the following functionality:

- Return sign of passed 64-bit signed integer
- Negate value of passed signed 64-bit signed integer variable
- Negate value of passed signed 64 bit signed integer variable if it is negative
- Compare value of passed 64-bit integer with 0
- Check that value of passed 64-bit integer can be stored to 32-bit integer without truncating
- Assign 32-bit value to passed 64-bit integer variable
- Assign 64-bit value to passed 64-bit integer variable
- Store 64-bit integer value to 32-bit integer variable
- Store DECIMAL value to 64-bit integer variable
- Store 64-bit integer value to DECIMAL variable
- Shift value of 64-bit integer value to given number of bits to left or to right and store result to another 64-bit integer variable
- Shift value of 64-bit variable to left to given number of bits and store result to another 64-bit integer variable
- Shift value of 64-bit variable to right to given number of bits and store result to another 64-bit integer variable
- Add value of one 64-bit integer variable to another one
- Subtract value of one 64-bit integer variable from another one
- Assign sum of two 64-bit integer values to passed 64-bit integer variable
- Assign result of subtraction of two 64-bit integer values to passed 64-bit integer variable
- Multiply value of 64-bit integer variable by 2
- Multiply value of 64-bit integer variable by 10, add passed 32-bit value and store result back to variable
- Multiply two 64-bit integer values and store result to passed 64-bit integer variable
- Divide value of 64-bit integer variable to 10 and store quotient back to variable
- Store result of division of two 64-bit signed integer values to passed 64-bit variable
- Store result of division of two 64-bit unsigned integer values to passed 64-bit variable

Next time

That's it for the new files. Next week I'll take a look at some of the many changes to existing files in 9.1.

Clarion 9.1 build 11038 release notes

```
/--- Beta release (11) Clarion 9.1 --- May 27 ----- Fixes/Changes/Features---/

Note: The 9.1 release requires a one-time rebuild of all your Binaries (DLL
and LIB).
You need to download the 9.1 versions of any 3rd party addons that you use.

*****
9.1 beta 11 (pre-release) - 11038
*****
CHANGE: Better error messages are displayed if you have an invalid email
address
CHANGE: Mail messages sent via the MailClient class now have the subject and
body automatically clipped
CHANGE: The OnScreenKeyboard options are now On/Off/Auto, The default setting
is OFF. When set to 'Auto' the value for enabling the Keyboard is turned ON
if the OS reports the device has a Touch Input, otherwise it is set to OFF.
NOTE: The enable/disabling of the OnScreenKeyboard can be done globally for
the app at runtime by calling the the method SetOnScreenKeyboard() with True
or False.
CHANGE: The email functions return more information when an error occurs if
they are configured to display error messages
CHANGE: change Topscan to use .CHM format help file
CHANGE: rename abado.tpl to SVabado.tpl so that when re-registering all
templates the ADO template won't fail because the core ABC template isn't yet
registered
FIX: Email addresses passed to the CC and BCC parameters of the Send methods
of the MailClient class where not correctly converted if there was only an
email address supplied and no name
FIX: Exception if the CREATE statement is called to create a control in a
report but with the type using the CREATE:Toolbar flag
FIX: Images embedded in emails could not be displayed by receiving email
readers
FIX: Potential GPF on closing the MDI frame window if active MDI child has
its own/cloned menu bar or toolbar
FIX: The documentation of the embeddedImageFileNames parameter was wrong
FIX: The error message displayed when a reply to address was invalid showed
the wrong email address
FIX: non-English characters in the name of email addresses were not encoded
based on the passed encoding
REGRESSION: A Frame toolbar with the NOMERGE attribute might not be redrawn
after closing a MDI child window
```

Clarion 9.1 under the hood - Part 2

In [Part 1](#) I had a look at the new files (templates, source, etc.) shipping with Clarion 9.1; now it's time to see what's changed in the existing files.

[Browse changes](#)

The release notes for build 10971 have this note:

FEATURE: Added methods to ABBrowse to enable or disable the showing of the wait cursor in a Browse
SetUseWaitCursor(True/False)

In 9.0 when there's a potential delay the code calls SetCursor to show a standard wait cursor. Now you can override this behavior via the supplied methods.

In `abbrowse.clw` in 9.0 you'll see these comments:

```
!The SELF.ILC.Choice() - SELF.ILC.GetControl(){PROP:YOrigin} + 1 expression  
!will be encapsulated in a new StandardBehavior method  
!SEL = StandardBehavior.GetSelectedRow()
```

This change has been implemented; ILC is the IListControl interface, and it now has a GetSelectedItem method. I suppose there's some benefit to this but it's not clear to me what it might be. If you have an idea, please post a comment.

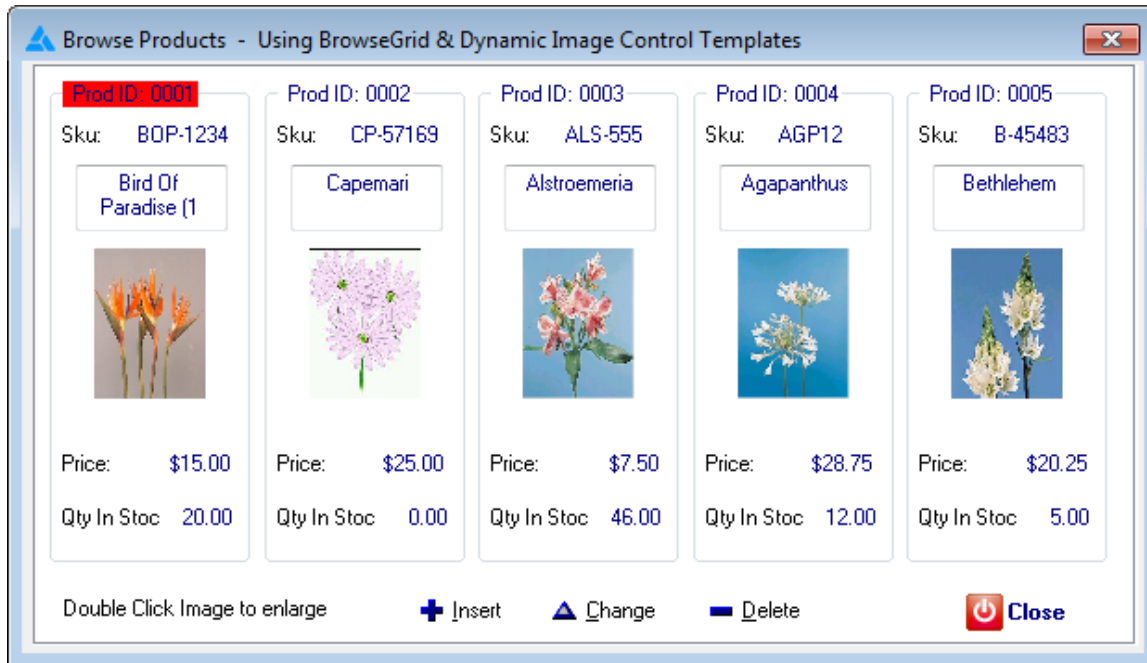

This change also affects the GridClass, which is supporting code for the BrowseGrid template.

I have to confess that I've never, ever used the BrowseGrid in anger. The help says this:

The BrowseGrid template provides a group control that is used to define an area (within a BrowseBox) to display controls in a matrix format. The size of the BrowseGrid control and BrowseBox can be manipulated to give the end result of a matrix with one column or many. When this template is added, the BrowseBox control does not display at runtime.

This feature is particularly useful for Web applications, but can also extend the capabilities of desktop applications.

There is a sample app called BrwGrid. Here are a couple of grids from that app:

While there's nothing really new in this sample app, as always when I go trawling through the Clarion code base I find templates and code I think I really should be trying out.

ABPOPUP.inc shows a new method, which appeared in build 10916:

FEATURE: Added Method to the PopupClass - "EmptyItems" to empty the popup items when needed

Nifty.

There are also new Ask and GetText methods. The new Ask is an overloaded method, apparently in response to PTSS 37601: "In PopUpClass.Ask please support the 3rd parameter that the POPUP command does". The GetText methods matches the SetText method and lets you retrieve the menu text for a specified popup menu item name.

XML class changes

There are lots of changes in the abprxml.inc and abprxml.clw files. A lot of these seem to be related to the refactoring of an XMLWriter base class out of the XMLGenerator class.

Window resizing

The WindowResizeClass gets two new methods, WindowResizeBegin() and WindowResizeEnd(). As stated in the release notes these provide notification of the start and end of resizing.

The window resizing code also shows something I've noticed in other source files - more extensive error trapping and reporting. Asserts() statements now often include the Error() value or some other explanatory text as a second parameter.

ABUtil

Abutil.inc and .clw contain a variety of utility classes:

- ConstantClass
- FieldPairsClass
- BufferedPairsClass
- INIClass
- SelectFileClass
- TranslatorClass
- CalendarBaseClass
- CalendarClass
- CalendarSmallClass

- CalendarSmallTouchClass
- CalendarSmallTouchIconsClass
- CalendarSmallTouchRegionsClass
- DynaStringClass

All of these classes are in 9.0 also, and most of them are in Clarion 8, but again it's easy to overlook this code as these classes are all lumped together in one file pair. I think this is just another argument for maintaining a one class per file rule and using a class naming convention.

There are some changes to these files, mainly involving the movement of some declarations for days of the week from one file to another.

WindowManager

The WindowManager gets a new ModalEvent method which returns true of the current event is

```

WindowManager.ModalEvent      PROCEDURE ( )
controlId LONG,AUTO
CODE
CASE EVENT ( )
OF EVENT:Contracting
OROF EVENT:Dragging
OROF EVENT:DroppingDown
OROF EVENT:Expanding
OROF EVENT:GainFocus
OROF EVENT:Iconize
OROF EVENT:LoseFocus
OROF EVENT:Maximize
OROF EVENT:MouseIn
OROF EVENT:MouseOut
OROF EVENT:Move
OROF EVENT:PreAlertKey
OROF EVENT:Restore
OROF EVENT:Selecting
OROF EVENT:Size
OROF EVENT:TabChanging
RETURN TRUE
OF EVENT:ScrollUp
OROF EVENT:ScrollDown
OROF EVENT:PageUp
OROF EVENT:PageDown
OROF EVENT:ScrollTop
OROF EVENT:ScrollBottom
OROF EVENT:ScrollTrack
OROF EVENT:ScrollDrag
controlId = FIELD ( )
RETURN CHOOSE (controlId {PROP:IMM})
END
RETURN FALSE

```

This looks quite interesting, but I'm really wondering why I need to know if an event is modal. Anyone have an idea about this one?

ClaRunExt.dll/inc/clw

There are some changed and new prototypes in ClaRunExt.dll. The image manipulation functions (image to PNG, rotate/flip, and save thumbnail) take pointers to strings instead of cstrings for the filenames, and there are two new functions for sending email and SMS messages. There's also some interesting use of function pointers here that looks worth investigating.

CWUtil.inc

CWUtil.inc has a new HasTouchInput() function, presumably to determine if the device running the program supports touch inputs.

EFocus.inc/clw

There are two classes in EFocus, EnterByTabClass (unchanged from 9.0) supports the use of Enter to complete fields (typically for heads-down data entry) and EnhancedFocusClassType, which adds visual indicators of field focus and gets some touch support, including the ability to set an on-screen keyboard for touch devices.

Equates and properties

There are some new time equates:

```
! Special time values
TIME:MIDNIGHT      EQUATE (1)
TIME:NOTIME       EQUATE (0)
TIME:ERROR        EQUATE (-1)
```

which are Mike Hanson's fault. And I need to get Mike in here to explain the current state of SoftVelocity's attempt to handle the time inconsistencies Mike pointed out, and why the attempted fix caused so many problems.

There are also some groups for 64 bit integer handling:

```
! 64 bits integers
  OMIT('***', _BUILTIN_I64_)
INT64  GROUP,TYPE
lo      ULONG
hi      LONG
      END
UINT64 GROUP,TYPE
lo      ULONG
hi      ULONG
      END
! ***
```

There are some new properties as well:

```
PROP:Locale      EQUATE(7A76H) ! integer: SYSTEM or FILE LCID value
PROP:Codepage    EQUATE(7A77H) ! integer: SYSTEM or FILE codepage value
PROP:NoFont      EQUATE(7A78H) ! boolean:
PROP:TouchInterface EQUATE(7A79H) ! integer: get the interface to touch input
PROP:TimeZeroIsLongOne EQUATE(7A7AH) ! boolean: set how TIME(0) to LONG conversions
are handled
```

I'm puzzled by PROP:NoFont, which I don't see in the help, nor does it seem to be used anywhere in the source or templates.

InternetConnect files

InternetConnect is a mostly-forgotten technology used to present Clarion apps across the internet. Some of that code is being repurposed for SoftVelocity's upcoming H5 product. There definitely are some changes in the IC*. files in 9.1, but how significant those changes are I don't know. If anything there is less IC code in 9.1 than in 9.0, so perhaps the current work is being done elsewhere.

JSON support

The ClarionSharp blog entry on H5 contains this mention of JSON:

H5 apps use the jQuery library, either jQuery UI or jQuery Mobile (UI), and JSON for updating client side data without a full page refresh. They run under the AppBroker SE, so you just install the service and deploy — no IIS knowledge required.

JSON stands for JavaScript Object Notation, and is a simple data format with a wide variety of uses. You can find out more at <http://www.json.org/>

As with XML, there is a growing need in Clarion apps to easily convert to/from JSON structures. JSON support is already in Clarion 9 in the form of JSONDataClass, but 9.1 adds a number of new methods for conversion, data formatting and string parsing.

QuickXmlParser.inc/clw

The XMLParser and XMLFileParser classes have a few changes, among them the addition of some tracing code using OutputDebugString. Having worked with XML extensively over the last few months I'm sure that code was added out of necessity.

As with a lot of things buried in the Clarion source code, these classes look like they could be quite useful on their own.

WinExt.inc/clw

This WindowExtenderClass is heavy on system tray functionality but adds some other nice bits. The IsInstanceRunning and RestoreInstanceRunning functions now have optional process name parameters:

```
IsInstanceRunning      PROCEDURE(<STRING processExeName>),LONG !Return the
instance running other than this one
RestoreInstanceRunning PROCEDURE(<STRING processExeName>),BYTE !If the process is
ommitted it refere to the current process name returned by GetEXEFileName()
processExeName must be Filename.Ext
```

All those classes

All those classes I hadn't noticed before (or thought about for a while) made me wonder just how many classes ship with Clarion. [See the list here](#)

Next time

That's all for this edition. Next time I'll conclude with a look at the template changes, and I'll list what I consider the most interesting items from the release notes.

The many classes of Clarion 9.1

While reviewing the source code changes in Clarion 9.1 I was again struck by the number of classes I'd never really noticed before. How many classes are there? I found 468. Here they are in alphabetical order:

```
Access:SV_SqlScriptFile      CLASS(FileManager)
AddressVisual                CLASS(WindowManager)
ADOBlob                      CLASS
ADOConnection                CLASS(CConnection)
ADOConnectionEvents          CLASS(CConnectionEvents)
ADOError                     CLASS(CError)
ADOErrors                    CLASS(CErrors)
ADOFIELD                    CLASS(CField20)
ADOFIELDS                    CLASS(CFields)
adoHelpers                   CLASS
```

Clarion 9.1 build 11054 release notes

```
/--- Beta release (12) Clarion 9.1 --- June 4 ----- Fixes/Changes/Features--/
```

Note: The 9.1 release requires a one-time rebuild of all your Binaries (DLL and LIB).

You need to download the 9.1 versions of any 3rd party addons that you use.

```
*****
```

```
9.1 beta 12 (pre-release) - 11054
```

```
*****
```

FIX: A GPF could be thrown when menus were redrawn after closing a window

FIX: Builds could crash if the last folder in a line in the redirection file was surrounded with quotes

FIX: Mouse wheel did not scroll LIST contents or generate scroll events if VSCROLL attribute was missing

FIX: The WM_MOUSEWHEEL message must be forwarded to the client window to allow correct scrolling of WINDOWS for compatibility with some mouse drivers

FIX: TopScan: After a Search succeeded the Found record was not highlighted

FIX: When the eMail and SMS Template is enabled the system will copy the ClaRunExt.DLL to the target directory

PTSS 40735: Mouse wheel not working on window scroll

PTSS 40776: MouseWheel scroll not same 9.1 to 9.0

Clarion 9.1 build 11129 release notes

```
*****
```

```
9.1 beta 13 (pre-release) - 11129
```

```
*****
```

NEW: Added more public functions for working with 64-bits integers

NEW: Added support for Win8.1 in the generated manifest

NEW: Clarion Chain: New embed; "WindowEventHandlingBeforeFirstFieldSelect", allows code to be inserted just before doing the SELECT of the first control when the window opens

NEW: added EQUATES for additional paper formats (equates.clw)

CHANGE: JSON: EscapeString implementation changed to use calculated size of the output string

CHANGE: TaskList - auto resize the columns automatically only if the panel is resized or docked/un-docked

CHANGE: TaskList - column type and line number columns now always resize to

its best fit the content

CHANGE: TaskList - double clicking on right border did not resize all the columns

CHANGE: added message when a project fails to save because it is read-only (usually in a build process) NOTE: The message can be disabled using the tools-options- Projects and Solution: Show Message when saving Read Only Projects

FIX: Builds did not work if you used the %THISDIR% redirection macro more than once on a line in a redirection file

FIX: Changing a redirection file that is active because it is included using the {include} directive would not cause the redirection system to reload the file if there was a space between the redirection file's name and the closing } in the {include} command. i.e. if you had {include test.red} and changed test.red, then the changes were automatically included in the redirection system, but having {include test.red } meant the changes were not active unless you first reloaded the solution.

FIX: Changing detail band's position could affect its subsequent printed instances.

FIX: Changing the hot state could clear the disabled state for Buttons

FIX: ErrorPad column sizes were not saved if there was no Solution open when resized

FIX: FILEERROR and FILEERRORCODE were not set correctly if a connection error occurred when connecting to Oracle and the connection was not being raised on the main thread. This meant that any connection errors did not appear when you tried to connect to an Oracle database while importing or synchronising tables into a data dictionary.

FIX: If you edited an existing directory in the list of directories scanned by the ABC scanner in the Tools/Options/Clarion/Versions dialog, the File dialog did not start in the directory that you were trying to edit

FIX: PDF Output text was stored with the width of the font in PPI instead of DPI

FIX: PE Version was not freeing memory after code generation

FIX: POSITION(View) would return an incorrect position string after a call to REGET(View, position) if the view contained joins and at least one of the joined records was NULL

FIX: PROP:LineHeight could return incorrect value for multi-line TEXT controls

FIX: Passwords were not hidden when importing/synchronizing from an SQL database

FIX: Resizing problems, the "Enable Auto size BrowseBox Columns" was interfering with the Anchored resize.

FIX: Two EVENT:Accepted events could be posted by a pressing button's hot key right after pressing the button with the mouse

FIX: Unload project message was displaying an internal Id

FIX: UserControl template was generating the class for all the user controls in the window

PTSS 40778: failure on position/reget sequence on view

PTSS 40781: Event:Accepted Fires Twice on Button with hotkey and certain mouse click sequence
PTSS 40878: Resizing problems

Clarion 9.1 build 11139 (Gold) release notes

9.1 (Gold-release) - 11139

CHANGE: JSON: EscapeString implementation changed to use calculated size of the output string
CHANGE: TaskList - auto resize the columns automatically only if the panel is resized or docked/un-docked
CHANGE: TaskList - column type and line number columns now always resize to its best fit the content
CHANGE: TaskList - double clicking on right border did not resize all the columns
CHANGE: added message when a project fails to save because it is read-only (usually in a build process) NOTE: The message can be disabled using the tools-options- Projects and Solution: Show Message when saving Read Only Projects
FEATURE: Topscan - added persistent edit mode support using Tab/ShiftTab and Up/Down keys in edit mode to select another active EIP control
FEATURE: Added more public functions for working with 64-bits integers
FEATURE: Added support for Win8.1 in the generated manifest
FEATURE: Clarion Chain: New embed;
"WindowEventHandlingBeforeFirstFieldSelect", allows code to be inserted just before doing the SELECT of the first control when the window opens
FEATURE: added EQUATES for additional paper formats (equates.clw)
FIX: Builds did not work if you used the %THISDIR% redirection macro more than once on a line in a redirection file
FIX: Changing a redirection file that is active because it is included using the {include} directive would not cause the redirection system to reload the file if there was a space between the redirection file's name and the closing } in the {include} command. i.e. if you had {include test.red} and changed test.red, then the changes were automatically included in the redirection system, but having {include test.red } meant the changes were not active unless you first reloaded the solution.
FIX: Changing detail band's position could affect its subsequent printed instances.
FIX: Changing the hot state could clear the disabled state for Buttons
FIX: ErrorPad column sizes were not saved if there was no Solution open when resized
FIX: FILEERROR and FILEERRORCODE were not set correctly if a connection error occurred when connecting to Oracle and the connection was not being raised on the main thread. This meant that any connection errors did not appear when

you tried to connect to an Oracle database while importing or synchronising tables into a data dictionary.

FIX: If you edited an existing directory in the list of directories scanned by the ABC scanner in the Tools/Options/Clarion/Versions dialog, the File dialog did not start in the directory that you were trying to edit

FIX: PDF Output text was stored with the width of the font in PPI instead of DPI

FIX: PE Version was not freeing memory after code generation

FIX: POSITION(View) would return an incorrect position string after a call to REGET(View, position) if the view contained joins and at least one of the joined records was NULL

FIX: PROP:LineHeight could return incorrect value for multi-line TEXT controls

FIX: Passwords were not hidden when importing/synchronizing from an SQL database

FIX: Possible memory leaks on setting a PNG file to IMAGE control

FIX: Possible string stack overflow on getting the PROP:VScroll property for a multi-line TEXT controls

FIX: Resizing problems, the "Enable Auto size BrowseBox Columns" was interfering with the Anchored resize.

FIX: Topscan - export of TPS files to text worked incorrectly

FIX: Two EVENT:Accepted events could be posted by a pressing button's hot key right after pressing the button with the mouse

FIX: Unload project message was displaying an internal Id

FIX: UserControl template was generating the class for all the user controls in the window

PTSS 40661: Repeated ?Image{PROP:Text} = 'Some.png' eventually blows up

PTSS 40778: failure on position/reget sequence on view

PTSS 40781: Event:Accepted Fires Twice on Button with hotkey and certain mouse click sequence

PTSS 40875: Buttons do not draw as disabled

PTSS 40878: Resizing problems

PTSS 40891: reading Prop:VScroll in Timer loop causes Exception
PTSS 40893: RTL Crash. Cannot upgrade without a Fix
PTSS 40894: Incorrect assignment in FillZoomControl

Clarion 9.1 build 11220 release notes

/--- Clarion 9.1 update --- Sept 12, 2014 ----- Fixes/Changes/Features--/

Note: If this is your first time working with 9.1, the 9.1 release requires a one-time rebuild of all your Binaries (DLL and LIB).

You also need to download the 9.1 versions of any 3rd party addons that you use.

FEATURE: The Clarion to SQL converter now converts the following operators for the specific drivers -

 % (Modulo) All drivers

 ^ (Power) Pervasive SQL, Oracle

 & (Concatenate) All drivers. Note that ODBC uses the ANSI standard

||

 XOR (Exclusive OR) SQLAnywhere, MSSQL

FIX: Possible IDE lockup when there is very large number (hundreds) of local/global variables, and tables in the procedure and IDE is processing the closing of an embed

FIX: OLE Automation could be treated as side-by-side instead of an OLE server in a separate process

FIX: StdFunc.tpw: Incorrect assignment in FillZoomControl

FIX: After changing a field's size you could not set the OVER attribute for a field to all possible values without first saving changes and then editing the field

FIX: Background under active IMAGE controls could be painted incorrectly

FIX: Importing a dctx with a blob in it imported it incorrectly as a memo

FIX: Instances of #CODE templates are removed from the APP if the template was unregistered but the corresponding code responses were not deleted from the embed tree

FIX: PNG images with an alpha channel could prevent repainting the background under them

FIX: Possible failure on closing APP if embed tree with orphan embeds has been touched

FIX: Possible memory leaks on setting a PNG file to IMAGE control

FIX: Possible string stack overflow on getting the PROP:VScroll property for a multi-line TEXT controls

FIX: ReportWriter: License validation could fail in Windows with language other than en-US

FIX: Scrolling of LIST controls without both the vertical scrollbar and the IMM attribute

FIX: Topscan: Clicking outside the row being edited did not stop edit mode

FIX: Topscan: Possible run-time error if the File's record structure contains arrays

FIX: Variable return types were not allowed in prototypes in the Procedure Properties dialog

CHANGE: The DataPad does not pause the IDE when refreshing its content upon procedure selection (improved response time)

CHANGE: Topscan: Apply font to the driver string builder's dialog

PTSS 40852: Using OLE automation to paste data to Excel fails win 9.1, works in 9.0

PTSS 40894: Incorrect assignment in FillZoomControl (STDFUNC.TPW)

PTSS 40937: TopScan 9.1 Entering a new record

PTSS 40958: Excel COM Object

PTSS 41010: The SQLite Driver Does Not Handle Concatenation Properly
PTSS 41016: When doing a group place over, e.g. for an Sql date string, the drop-down didn't show the preceding datetime string

Clarion 9.1 build 11242 release notes

/--- Clarion 9.1 update .11242 --- Sept 26, 2014 -----
Fixes/Changes/Features--/

Note: If this is your first time working with 9.1, the 9.1 release requires a one-time rebuild of all your Binaries (DLL and LIB).

You also need to download the 9.1 versions of any 3rd party addons that you use.

FIX: A random "missing pure virtual" exception could be thrown by the evaluator

FIX: Possible lockup if Listbox height is enough to show only one row but the row is multiple lines

FIX: Programs would randomly crash after printing a report in a repxl file

FIX: RW: The Print selection dialog would crash on some operating systems when called from a report writer report called from a Clarion program

FIX: RW: The print previewer would lock up if you clicked on the Open file button

FIX: RW: The report preview window was appearing in the task bar

FIX: RW: The report previewer was locking up when exporting to file

FIX: SETDROPID could work incorrectly on dragging between 2 Clarion applications

FIX: The application generator could not open an app after you edited its dct and deleted a file that had aliases.

PTSS 40983: Delete Table with Alias will make app crash
